The Old Year and the New.

HE old year has passed, but not into oblivion. Many important events will keep 1919 fresh in our memories during the years to come. Gradually we have passed from war to peace, and we are emerging from the turmoil considerably changed. Many of our old-time customs have passed away never to return. Many innovations have come to stay. Motor cycles remain, and their future appears rosier than ever. During the war, the movement was greatly strengthened by the number of people who were brought into immediate touch with things mechanical, and by the re-distribution of wealth which has brought the motor cycle within reach of thousands who could not afford to buy before the war.

The demand for motor cycles is immense and is steadily increasing, and it will be a long time before supply will catch up demand. Gradually the motor cycle factories of this country have been returning to their pre-war occupation and their ranks have been strengthened by several notable newcomers. Here and there are firms which have been producing motor cycles throughout the war. Such firms have the advantage of existing plant and machinery and the added experience gained from the gruelling test to which their products were subjected. So far novelties are few and far between, and most of them have originated from new firms, but novelties stand a better chance than ever before.

e material have Labour troubles and lack delayed both deliveries and orks reorganisation, so at the present time there is a distinct shortage of motor cycles. What of the future? Delivery is not likely to be accelerated for some months to come; the moulders' strike has delayed matters to such an extent that there can be no considerable deliveries till some weeks after the return of the men, but, granted an early settlement and a quiescent state of labour, the prospects for the summer are excellent; new factories will be getting into their stride and

new designs will have passed the "trying out' stage, competition work will have settled down in earnest, and the revival of the classic Tourist Trophy event will add an extra fillip to both trade and public. The new class for lightweights, the winner of which will carry off the cup presented by The Motor Cycle, will help along a type of motor cycle in which an enormous section of the public is interested.

Altogether, the year promises to be one which will mark important developments in the motor cycle movement, and to all connected with itriders and makers—we offer our best wishes for a happy and prosperous New Year.

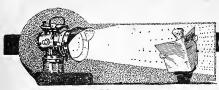

An Opportunity for Manufacturers.

E recently drew attention to the significance of a very noticeable movement in France towards the wider adoption of the sidecar machine for trade purposes, and we feel that no apology is needed for again reverting to the subject.

It will be remembered that a Parisian firm is running a fleet of sidecars, and hiring these out to tradespeople for delivery purposes. The propaganda value of such a project is apparent, although it was conceived primarily for the profit of those concerned.

Had the scheme been organised by the actual makers of the motor cycles used, it would have been still more valuable. Such an arrangement would at least demonstrate unflinching faith in · their own products, and, incidentally, would provide an admirable test under real working conditions, besides bringing them into actual touch with prospective clients.

We think such a scheme might easily and profitably be inaugurated by some of our-own manufacturers. The opportunity of thus demonstrating the performance and reliability of machines which are second to none in the motor cycle world is one that is too good to be neglected.

casional Commen

(By Ixion' -

Noise.

S our old readers know, I am an unrepentant heretic on the subject of silent machines, and as such am boycotted by the rest of our editorial staff. My chief excuse is that I am a country mouse, and whenever possible reside away from roads which are designed with a straight-edge and infested by trams. On my way home recently, for example, I negotiated no fewer than eleven absolutely blind corners. On roads of such a character noise is the only valid insurance. It is good for me to make as much noise as I can, and if I meet another fellow near any of these corners, I prefer his machine to be as noisy as possible. The same applies to cars, only in that case the noise is created by a fusillade of toots from a Klaxon or some other raucous road clearer. If anybody retorts that reducing speed to a crawl is a better way, I reply that people will not do it. Put any brand of motorist to live in a district which abounds in curly lanes; he will drive as a young mother out with her first baby pushes the new pram-for one week. Before long, immunity from accident will have made him audacious, or accident will have removed him to the cemetery or a hospital. Similar reasoning applies to certain traffic conditions. Not to Coventry, where the crush is so great that pace is impossible. But to the suburban outlets of many cities, where either hooting or an audible mechanical whirr or a reasonable exhaust note is desirable in the interests of motorist and pedestrian alike.

The Ideal.

HAVE not the least wish to side a noisy machine where noise is useless. My own ideal is three-fold. I should wish my buses to be:

 Genuinely noisy when noise is, in my discretion, a safeguard.

2. Absolutely silent, where silence in my opinion is safe as well as pleasant.

Free from mechanical noises at all times.

My present mount makes a moderate noise at all times; and 50% of its noise is mechanical noise. Wherefore from my standpoint it is just about as bad as a machine can be. One of my neighbours has an Indian which on small throttle openings creates no sound beyond the mild swish of well-lubricated chains. I often wish the fellow's silencer would fall off. He is a daring cornerist, and has little use for a hooter. If he does not die or move presently, I shall. Anyhow, if and when the powers that be compel us all to ride machines which are dead silent I shall emigrate.

The Light Four-wheeler.

S our article on pages 746-749 in The Motor Cycle for December 11th showed, there are signs of a new boom in light, cheap four-wheelers of the type which users-in defiance of A.C.U. and R.A.C. terminology—continue to describe as cycle

cars. Simultaneously the hardy little G.N. puts up a 400 mile engine non-stop under official observation, and is promoted to the honour of a full technical description in The Autocar. Moreover, one hears rumours that at least one four-wheeled cycle car is going into mass production, and that its price is coming down plunk to a figure which may make the average sidecar blench with panic. We have had booms in light four-wheelers before, and I am far too canny to jump at conclusions. But the prospects are quite rosy. The G.N. has proved itself long since. Some of the new four-wheelers look very clean jobs. What, for example, could be more taking to the eye than the-Barnard and Black Prince, as illustrated in the article above-mentioned? My trained eye notes that both pictures are washdrawings, not road photographs from life: wherefore I judge there will be a waiting period. But, perchance, the three-wheeled runabouts will enjoy less of a walkover in 1921 than some of them anticipate.

Kick Starters.

R. DUNSTON and other correspondents do me an injustice, or else my paragraph was unwit-tingly so phrased that it evidently failed to convey my point about kick starters. That the average kick starter will start its engine is undeniable. It is equally true that many kick starters would stand a great deal of improvement. Anybody who keeps his eyes open will daily see men with kick starter machines utilising the push start, even on the level. I myself am neither fat, old, short-legged, inexperienced, nor weak. But even when my engine is hot, I always push off my present mount unless the road is uphill. Its kick starter is an inconvenient and exhausting method of starting, which I reserve for emergencies. I admit there are kick starters to which these criticisms do not apply. My point was that the average kick starter does not furnish such an easy and certain start as many of our less capable riders desire, whilst the superiority of certain patterns indicates that other designs require attention.

A Narrow Escape.

THE other day both a companion and I had somewhat narrow escapes from accidents of a distinctly unusual kind. In the early days of motoring, motor car and motor cycle owners travelled in a state of uneasiness about their brakes. Car brakes were small, and lined with friction materials which charred on long hills. Motor cycles were uniformly equipped with the Bowden rim brake or push-cycle type. It was not at all a bad brake when properly fitted and maintained; but mechanics took the wire round sharp corners or failed to solder the nipples properly: vibration shook the shoes out; buckled rims upset the shoe contact; and careless owners neglected the adjustment devices. Then the belt rim shoe came along, and our worries vanished. Now that the chain

Occasional Comments.-

is ousting the belt, ancient difficulties and dangers tend to return. On the occasion cited, I was riding a chaln-driver with an external band brake operated by a stranded wire, not of Bowden manufacture, but approximating to the fencing type of wire. By a kindly miracle, this wire pulled out of its nipple when I was stopping on a level road to light a pipe, so that I suffered no injury. The companion referred to suffered his brake failure with another make of chain driver whilst descending a bad hill; and his new machine was wrecked so thoroughly that he could not tell why the brakes failed. Incidentally, a third member of the party was afflicted by a belt rim brake with a shoe made of some substitute material which grew in wet weather, so that

IN AND AROUND OXFORD.

after a few miles in the rain the brake was permanently on. These experiences suggest that

AS I follow the correspondence on the merits of universal rear lights, I notice that most of the controversialists plainly consider no conditions other than broad, straight highways like the Portsmouth Road. Their arguments imply that you can see half a mile ahead, and can easily swing a yard or two out to your right if your head lamp suddenly reveals a cart or a cyclist a few yards in front. Quite half my own riding is done in country lanes, and a good percentage of my annual mileage is accomplished along lanes which are alike narrow, rutsome, and twisty. Under such conditions, you can seldom see more than a short distance ahead, whether by night or

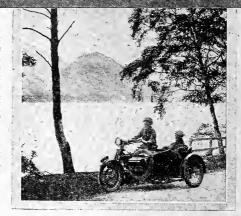

day. It is often a physical impossibility to pass a cart or sidecar for hundreds of yards together. When the surfaces are greasy, it is a matter of some delicacy on a motor bicycle to pass a push bicycle. The lane is perhaps only 6ft, wide, and the crown between the central ruts is possibly the only strip of the road on which either of you can feel really comfortable about maintaining the perpendicular. If you overtake a cyclist who has no

rear lamp, you may come upon him rather suddenly. Either he will sideslip in his anxiety to take the edge, or you may skid in your hasty effort to swing wide of him. A tail lamp is an invaluable safeguard under such riding conditions, even though the motor cyclist is riding under an automatic speed limit, just as on French pavé. The proof of the pudding is in the eating. In such districts there is often only one policeman to twenty square niles or 'so, and the locals always know where he is, so that they are under no real compulsion to light their tail lamps. The carters often travel through such districts with neither head nor tail lamps, but the cyclists never. They know that a good tail lamp is a great safeguard to them.

additional care is requisite in designing brakes, now that the industry as a whole is departing from the well-tried patterns of the last ten years. Modern machines are so fast and often so heavy that a powerful and absolutely reliable brake is essential. Considering the uselessness and even danger of many front wheel brakes, it is desirable on heavy machines to fit two rear wheel brakes. One good brake is sufficient for emergencies, and the second brake would be available if the first failed. Front brakes are necessarily adjusted so that they cannot stop a machine rapidly when the rear brake fails. As practised riders know, the proper expedient in the event of a brake failure is to change down to bottom gear and shut the throttle.

With a Lady Pilot over Lakeland Heights

RECORD season in the Lake District has prevented one from joining in many a merry onslaught on famous hills during the past glorious summer. Numerous invitations have had to be refused, and parties of enthusiasts have been watched with envy, as, with all the keenness, bustle, and uproar of prewar days, they have set forth for the happy hillhunting grounds. Certainly a few of the "old hands" have been missing, and on some of the famous hills the attack has frequently had the worst of the argu-

A peep through the birches by Bassenthwaite Water

Rugged old Honister from the Buttermere side has handled many a would-be conqueror roughly, and recent spring frame devotees have had keen disappointments. From the writer's observations, it is more difficult to climb the famous hill on one of these machines, and quite recently an expert trade rider failed on very ordinary Lakeland mountain roads.

Exploring New Hills.

Thus, when Mary Riley, the noted Enfield enthusiast, smilingly suggested a half-day on the hills, the absence of spring frame on her handsome new Enfield mount was no excuse for refusing the invitation. Moreover, pleasant memories of former excursions, notably the first lady's drive over Wrynose and Hardknott Passes, added force to the suggestion. The idea was to explore some new hills, and, with this purpose in view, we set out from Keswick on a perfect afternoon with sunny Skiddaw all draped in full splendour of heather and golden bracken. Whinlatter Pass is familiar to North Country motorists and other touring parties, but the old packhorse road which ascends directly from near Thornthwaite is practically unknown, and this was the object of our search. There was just time on the levels to appreciate the pleasant running of the new model 8 h.p. machine, which, despite the heavy load of three human beings and a camera, was to carry us up hill and down dale on the standard two-speed gear of 1 in 5 and 1 in 8.7. Too soon there came a quick turn to the left from the main road, and we were bumping up the narrow old-world lane past a pretty

By GEORGE D. ABR \HAM,

Awhor of"The Complete Mountaineer,"
"Motor Ways in Lakeland,"
"On Alpine Heights and British Crags," etc., etc.

Cumbrian farmhouse, where chickens with suicidal tendencies curbed the upward dash.

The actual hill came with startling suddenness round the grey cornery of a weathered barn, and there was just time to change to the lower gear before the first "hairpin" was encountered. A "mere man" had driven thus fat, so it was no surprise to find the machine making a thrilling swerve on the grassy bend

and finally floundering painfully to a halt on the steepest section. Then the lady driver showed us "how to do it," and, after a new start from the bottom of the hill with two aboard, it was a pleasure to watch from terra firma the non-stop ascent! Ladies know all about "hairpins" and the treacherous sample now engaging attention was negotiated most skilfully. Up and up the sturdy machine came, bumping and swerving as the driver keenly felt for firm grip on the steep, rugged gradient. At one point an unusual obstacle, in the shape of a drooping branch from an oak tree, had to be dodged cleverly below the toughest struggle, but this was passed, and ere long the writer was left to walk upwards with only. the song of a pretty mountain stream stirring the soft silences of the gorge. Soon the others were rejoined. and with the three aboard the upper part was tackled speedily. The writer was unable to hear of any motor previously making the climb, and doubtless this was the first ascent of a sidecar outfit. The hill will be a useful discovery for some of the forthcoming trials.

The Shores of Bassenthwaite Water.

Through sweet-smelling larches and bush, bracken slopes, we came finally out to the new road in the upper reaches of the pass. The strange sight of a sidecar, and one driven by a lady withal, rushing upwards apparently on a roadless mountain front, roused the astonishment of a motoring party of "Fordites." They stopped, and at first treated us as victims of an accident, whose sole aim in life was to regain the main road, and even after careful

With a Lady Pilot over Lakeland Heights .-

explanations they seemed to doubt our knowledge of our whereabouts. However, time was too precious to argue the point, and, bidding a lively farewell to the astonished party, we slid swiftly down the curving highway to Braithwaite, and thence, turning to the left, the way lay along the beautifully wooded shores of Bassenthwaite Water.

The sweet, silent running of the Enfield was here evident. Now in the soft shades of the woods and anon, flashing out into the silvery sunlight with Skiddaw's pink and purple frontage mirrored in the still waters, the run was altogether delightful. The

sudden approach to a stately heron preening itself by the shoreline recalled the fact that the famous old heronry close by has been saved by the ending of the war. The wholesale felling of the delightful woods of Wythop has been stopped, and one of the prettiest woodland runs in Northern Lakeland has been preserved.

At the Pheasant Inn-one of the most deservedly popular halting places in the road on the left which swerves up along the heights of Wythop was followed. Onwards and upwards we sped swiftly and steadily with a wonderful seaward prospect revealed. The quaint little mountain church perched on the lofty hillside far above human habitation was passed without a halt, and a capital road ledalong the hillside to the quaint old world village of

Not even a Wheelbarrow.

The sight of the pretty little village nestling in the depths of the tree-draped gorge suggested a halt, and enquiries were made for the mountain road over to

A Review of Mechanical Progress. -

is not a difficult matter to enclose all the normally exposed valve parts, provided that suitable provision is made in the original design, and by the use of a little ingenuity this can be done without rendering the tappets unduly inaccessible, and at the same time the springs can be made more readily removable. Certain American motor cycles have had enclosed valve gear for some time past. The exhibits at the Paris Salon showed the same laudable tendency, and at last there are signs of the idea being taken up by British manufacturers. While on this subject, it may be as well to mention that each spring and tappet should be entirely enclosed in a separate tube. The sheet metal attachments over the front of the springs are useless, and probably worse than nothing, for they act as dust traps and keep a

certain amount of draught away from the cylinders. A James model still in its experimental stage has a neat fitting on the right lines.

A neat design of leg shield fitted on the Ixion lightweight.

concerned, a great improvement is noticeable. Mechanical horns are often offenders in this way, and their designers might well give the matter a thought.

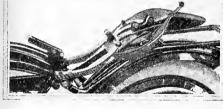

Cleanliness.

There is no object in trying to make a motor cycle as clean to ride as a car: it cannot be done, and any efforts in this direction, beyond a certain point, are only likely to spoil the motor cycle. These remarks apply especially to solo machines. At the same time much can be done to render motor cycling comparatively clean, which a few years ago it certainly was not. It is wonderful what a carefully designed underscreen and low leg shields will do towards protecting both machine and rider from mud. The Lea-Francis has always been good in this respect, and there are many firms who are now adopting

these fittings. A word of warning is necessary at this point, for if the material and methods of attachment are not carefully considered rattles will be the result. No owner can be proud of an engine that flings oil about and is in a constant state of mess. Here much improvement has taken place, and quite a number of makes may be considered blameless in this respect. The secrets of success are spigoted joints, good release valves, and, of course, . good workmanship.

Comfort.

This heading not only includes luxurious springing and seating accommodation, but with it are intimately bound up such questions as silence, cleanliness, and

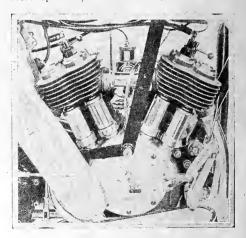

Novel saddle suspension employed on the Zenith mounts

Careful piston design will go far towards eliminating piston slap, but we are not likely to get a really silent engine until large plain bearings and forced lubrication come into fashion, and there are as vet no signs of this, though plain bearings and mechanical lubrication (as opposed to forced lubrication) are both becoming increasingly common. It may be worth while mentioning that a well-known designer and rider remarked on the great improvement as regards silence obtained by reverting to plain bearings throughout.

Transmission.

Most of the transmission noise emanates from the high speed primary chain and the gear box. The former problem has been tackled satisfactorily in two ways-by thoroughly enclosing the chain and running it in oil, as in the case of the all-chain Triumph and Sunbeam, and by utilising a silent chain for the primary drive as exemplified by Matchless and Rover machines. Modern gear boxes are wonderfully satisfactory as regards noise, and little improvement is likely to be made in this respect. Rattles, usually caused by mudguards, tanks, stands, and accessories, are abominations, but, as far as the manufacturer is

On the new experimental James 5-6 h.p. twin the valve springs are totally enclosed as shown

A Review of Mechanical Progress,-

freedom from such small matters as may be classed under the generic term of "tap twiddling."

Here perhaps we find the greatest evidences of advance during the past few years. Spring frames are becoming more and more common, saddles give increased comfort and are more scientifically designed (the new Barnes saddle being a great stride in the right direction), and new spring forks based upon correct principles appear almost weekly.

For some time past the writer has been inclined to scoff at spring frames as the requirements of an effete and luxurious generation, but since riding a modern solo mount fitted with a most efficient rear suspension he has changed his mind on the subject. Perhaps this is the effect of increasing years, but more probably

it is not.

There are many things that have to be tried before they can be fully appreciated, and amongst these is a simple system of mechanical lubrication. When one is accustomed to injecting a charge of oil every few miles it appears but little trouble, but once try a machine in which an occasional glance at an indicator is enough to ensure that all is well and hand lubrication becomes a Herculean and uncertain task. Similarly the automatic carburetter is a boon to all but the enthusiast, who, after all, is (and certainly will be) in the minority. Never before have there been so many machines fitted with these two devices, and their numbers are constantly increasing.

Attention.

All mechanism requires a certain amount of attention, and the motor cycle is no exception. Protection from mud and dust and proper mechanical lubrication are the best safeguards against wear and constant tinkering, but even the most perfectly protected motor cycle will need occasional decarbonisation and adjustment. Under these circumstances the best course is to make all parts that require inspection readily accessible.

Detachable, heads, which are again coming into fashion, go a long way to help decarbonisation, and gear units which carry their change speed levers in such a way that the adjustment is not upset when the box is shifted will do much to ensure that the tension of the primary chain is kept properly adjusted.

• In this connection a great many people seem to have missed one of the many good points of the new Raleigh. On this machine the gear box is fixed, but the engine is slidably mounted for purposes of chain adjustment, thus avoiding the necessity of adjusting both chains when only the primary drive needs attention.

Grease cups are generally taking the place of small cycle lubricators, but undoubtedly the easiest method of ensuring proper lubrication of cycle parts is that adopted by the Clyno. Here a grease gun with a screwed nozzle is employed, and each part requiring occasional lubrication is fitted with an adapter thread to suit the nozzle. This is a great labour-saving device, and at the same time ensures more thorough distribution of the lubricant.

The Future.

He would be rash indeed who would prophesy what the future will reveal, but certain hints may be gathered from experimental machines already on paper or even on the road. "Hot stuff" engines are reported to be doing marvels, and some of the designs show a real appreciation of essentials. For the first time in many years there are a considerable number of really "designed" engines, as opposed to modifications of 1903 practice, and the 1920 T.T. is likely to bring to light a very much larger amount of originality than the 1919 Motor Cycle Show. It is now certain that the 500 c.c. class will be retained in that event, and riders will have their work cut out to handle some of the new machines, and some of the more staid and conservative firms will have to look to their laurels if they are to retain their lead in speed events. Just one point favours the more conservative firms-they have the organisation; they know the type of bicycle to use, and the T.T. is not likely to be won by an engine, however good, unless the rest of the motor cycle is properly designed and manufactured. Young firms too often fail to recognise the vital importance of organisation on such occasions.

Perhaps the point which shows least improvement in the general run of motor cycles is in frame design, and, with a very few exceptions, there are little signs of progress in the immediate future. Here design seems to have got into a groove, but it is to be hoped that the groove will soon come to an end. Unque.

NORTHERN CRITICS ON SHOW DESIGN.

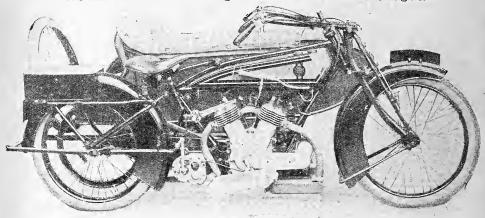

A T a meeting of the Newcastle and District Motor Club, Mr. James Cooper recently contributed an interesting paper on "Motor Cycles at the Show." The competition secretary declared that aeroplane design had not materially influenced the development of the motor cycle, and that many noted machines were practically 1914 models, slightly improved. He made caustic comments as to the appearance of many of the novelties whilst admitting that, although inartistic in aspect, their efficiency might conceivably justify their claims to careful consideration.

In discussion, Mr. Rex Morris contended that aeroplanes had influenced motor car design in such a way that the available horse-power in relation to weight had been considerably increased. Shortly, he said, there would be many light cars of, perhaps, 10 cwt. weight, and ten nominal horse-power, on the roads. These would be capable of very high speed, and, because of their real power and their light weight, it would be difficult to hold them to the road. But, unless they were carefully handled, this type of vehicle would be a source of potential danger to other road

Mr. Q. A. Nicol, O.B.E., Auto-Cycle Union Consul for the North-East, outlined the programme for the coming season, and said that a proposal was under consideration to conclude the Six Days Trial in 1920 with a run from London to Brooklands, for a final round on the track. The trial might, therefore, be increased to eight days duration, and such a test as the one in prospect, coming on the top of the ordinary Six Days Trial, would find out the inherent weak points of every machine.

A New Twin with an Old Name.

The Rex Co. reintroduce a Big Twin Model with 940 cc. Engine.

The twin Rex sidecar outfit, which was entered for the London-Exeter Christmas Trial

THOSE who have only joined the motor cyclists' fraternity during the past few years find it difficult to realise that about fifteen years ago the motor cycle was threatened with extinction. It had been tried by a comparatively large number of makers, but in its early state of development it was found wanting, and was dropped out of their programmes. A small "handful" of makers and The Motor Cycle, however,

A small "handful" of makers and The Motor Cycle, however, had sufficient confidence to "carry on" against obstacles and prejudice. Among these firms the Rex Motor Manufacturing Cowas one of the bæt known, and although it made both singles and twins, it is for the latter type that the company is better known by latter day motor cyclists. Following the introduction of the Rex sidecar "single," the oldestablished Coventry firm has now produced a twin on similar lines.

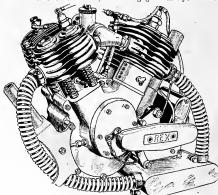

It will be appreciated from the illustration that the new model is a distinct departure from the prewar twin Rex. It is larger all round, is fitted with 28 × 3in. quickly detachable and interchangeable wheels, and carries a "spare" at the rear of the sidecar boot.

The engine has a bore and stroke of 80 mm. and 95 mm. respectively, the total capacity being 940 c.c. As in the late

1914 model, the lower part of the cylinder barrels is enclosed by the upper part of the crank case, between which and the cylinder walls there are annular chambers which are always full of oil. Two channels are cut in the walls of each cylinder, through which oil passes to the cylinders, the surplus dripping into the crank case, lubricating all other points by splash system and passing into the timing case to lubricate the plain bearings carry-

ing the two half-time wheels, from one of which the drive for the magneto is taken.

Each cam wheel has two cams, operating two pairs of rockers, those for the exhaust valves being supported on a centrally disposed shaft, and the inlets on separate shafts at each side. Enclosed exhaust valve lifting mechanism consists of two flat levers, which engage with lips

The Rex 1920 twin engine, which is similar to the power unit introduced late in 1914, but distinct from the type used in 1913-14.

on t'e rockers. They are carried on a shaft below that supporting the rockers, and extend through the timing case, where a lever is fitted and operated by a Bowden cable.

As will be seen from the illustration of the engine, provision is made for enclosing the valve stems and springs, a feature which makes for neatness, and the cylinders are held from the head by means of long swivel bolts. Roller bearings are used for the main bearings and big ends, the connecting rods being slightly offset.

The silencer pipes are of flexible tubing, bending in clean sweeps to a flat metal expansion chamber of large size, which is carried under the magneto platform.

From the engine to the Sturmey-Archer three-speed gear box the drive is by chain enclosed in a cast aluminium case, thence the drive is by belt to a separately built pulley wheel supported on its own ball bearing, which remains in position when the rear wheel is removed for tyre repairs.

All wheels are well mudguarded, and as an "extra" a pair of patented detachable winter guards is supplied for affixing to the valances of the front wheel guard. These increase the width of the guard by 400%, and while probably in the hottest weather of the summer they may screen the engine, in the winter months they should protect the driver from mud spray without detriment to the running of the engine.

Most of the constructural features of the "single" are retained in this new model, which, incidentally, will be known as Model 66. The brake pedal-shatt and the steering head have large

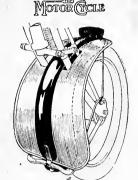

runit and the steering head have large 13-14. Inhricators, and the sidecar lugs are integral with the frame. The tank is of large capacity, and, in addition to the drip feed Inhricator, is fitted with an outside oil pump placed on the side of the tank further to the rear, and more horizontally disposed than is usual. The handle-bars are adjustable, the rear brake has a parallel action, and the equipment includes aluminium footboards. Brampton Billex forks, and large combined tool box and carrier.

A New Twin with an Old Name .-

Plated parts are conspicuous by their ablack, as are most of the littings. The Rex cantilever spring saddle-pillar is fitted as on the single-cylinder model, which it also follows as regards colour scheme, the tank being black with purple panels.

The sidecar is the same as fitted to

The sidecar is the same as fitted to the 4 h.p. model, and which created a very favourable impression at the Show. Cantilever springing is used, and the wheel is supported on both sides, the enter member being a large oval tube, which is hinged to facilitate removal of the wheel. The quality and finish all round are exceptionally good, and from an inspection of a number of both models in course of erection we should say that "show finish" is standard finish with all machines now turned out by the reorganised Rex Co. The price of the outil, complete with spare wheel and tyre, is £160.

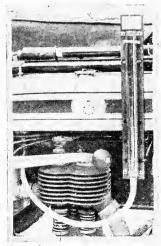

Something new in mudguarding. The Rex detachable winter guards for the front

A SIMPLE FORM OF PETROL CONSUMPTION TEST.

O NE of the facts which the average motor cyclist is most auxious to know is how much petrol his motor cycle is consuming. There are many ways of finding this out; for instance, starting on an empty tank and running the machine to a standstill on a measured quantity, or starting with a brim full tank, running a certain distance, and measuring the quantity of fuel required to reach the original level. In the first case, it is an exceedingly tedious job to empty the petrol tank, and in the second case, when a tank is filled as full as possible, the spilling of a certain amount of fuel from the filler

a certain amount of fuel from the inter-cap cannot well be helped.

That most ingenious inventor, Dr. A. M. Low, has devised a simple and effective scheme for quickly ascertaining the consumption of a motor bicycle over a short distance, by means of which useful data can be rapidly obtained. It consists of a small glass measure, protected by a brass tube, through which the glass is visible, the glass being graduated in cubic centimetres. It is provided with an elastic, the ends of which have hooks attached, and this enables the instrument to be clipped to the sides of the tank in a very few seconds. It is only necessary then to undo one of the unions, and connect the pipe to the carburetter. A start is made, preferably opposite a milestone or with the speedometer at zero, and a run of a mile is then taken. At the end of the mile the

The petrol consumption indicator designed by Dr. A. M. Low, fitted on a Triumph motor cycle,

reading of the gauge is taken, and this, divided into the number of cubic centimetres to a gallon (which is 4,546), gives the fuel consumption of the machine in miles per gallon.

THE 1920 TOURIST TROPHY RACE.

Two Races—500 c.c. and Junior T.T.—which will include a Lightweight Event for "The Motor Cycle" Trophy.

Thas now been definitely decided that the T.T. Races shall be held in the Isle of Man on the 15th and 17th of June. The Senior Race will be for motor bicycles with engines not exceeding 500 c.c., and the Junior Race in two classes—(1) for motor cycles with engines not exceeding 550 c.c., and (2) for motor cycles with engines not exceeding 550 c.c., and (2) for motor cycles with engines not exceeding 250 c.c.

not exceeding 500 c.c., and to to be covered exceeding 250 c.c.

The latter class will compete for The Motor Cycle lightweight trophy. This cup is to be won outright, and manufacturers will not be bound to place on the market machines of the type which have competed for the trophy. There is no limitation as to maximum weight, as it is considered that manufacturers of motor bicycles competing for this trophy will, for their own sakes, not make the machines heavier than they can possibly help.

For the same reason one would assume that there would be no minimum weight limit, yet this will be fixed at 88 lb., presumably to prevent freak designs, such as those bygone French racers which eventually brought about the F.I.C.M. weight minimums for both senior and junior races (132½ and 110½ lb. respectively). Nevertheless, such limits tend to discourage the very aims for which the lightweight prize is offered, i.e., to produce the ultra-lightweight machine. However, even 88 lb. lightweights would be a step towards the end in view, but if future designers produce machines weighing, say, 50 lb., it will prove that weight minimums in this year's T.T. will act as a brake to prevent too rapid development. Years ago, French designers produced comparatively high-powered machines weighing around 100 lb., and we have progressed in the last few years alike in engine, frame, and spring fork design, if not in weight reduction, and everything considered, one must agree that 88 lb. as a minimum is scarcely low enough. In any case, we do not expect to see any T.T. entrant for 1920 lighter than 100 lb.

ILKLEY M.C. & L.C.C. DINNER.

THE first post-war annual dinner and prize distribution of the above ciub was held on Friday, December 19th, and it proved a most successful function.

and it proved a most successful function. Much sympathy was expressed for Capt. J. Norman Longfield, the president and founder of the club, owing to his temporary loss of voice resulting from the recurrence of the ill-effects of a gas attack. His speech was consequently read for bim, and was greeted with great enthusiasm. In his speech he said that in arranging an open trial such as this club proposed to hold in 1920, it was absolutely necessary that the event should be perfectly organised. He suggested that the only possible method of securing this desirable end was to exclude their own club members from the competition, and thus ensure the full strength of the club for organisation, marshalling, and observation. This project would also climinate the possibility

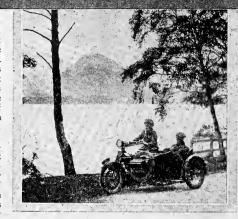

of their 'own riders gaining awards at the 'expense of those who were less familiar with the district and who consequently competed at a disadvantage. Many other clubs given to the organisation of open trials might well give some consideration to these points. Amongst other speeches during the evening were those by Lieut. Commander Pierce, on behalf of the A.C.U., Mr. H. W. Sellers (secretary), and Mr. D. H Smith The Motor Cycle.

One outstanding feature of the prize distribution was the fact that the whole of the awards, both trade and amateur, in the recent Scott Trial were secured by members of the Ilkley club.

A successful year is thus closed, and the members are keenly anticipating the holding of one of the limited number of open trials of 1920, the club having been provisionally granted a permit by the A.C.U.

With a Lady Pilot over Lakeland Heights

RECORD season in the Lake District has prevented one from joining in many a merry onslaught on famous hills during the past glorious summer. Numerous invitations have had to be refused, and parties of enthusiasts have been watched with envy, as, with all the keenness, bustle, and uproar of prewar days, they have set forth for the happy hillhunting grounds. The wholesale felling of the delightful woods of Wythop has been stopped, and one of the prettiest woodland runs in Northern Lakeland has been preserved.

At the Pheasant Inn-one of the most deservedly popular halting places in the North of England-the side

road on the left which swerves up along the heights of Wythop was followed. Onwards and upwards we sped swiftly and steadily with a wonderful scaward prospect revealed. The quaint little mountain church perched on the lofty hillside far above human habitation was passed without a balt, and a capital road led along the hillside to the quaint old world village of Wythop Mill.

Not even a Wheelbarrow.

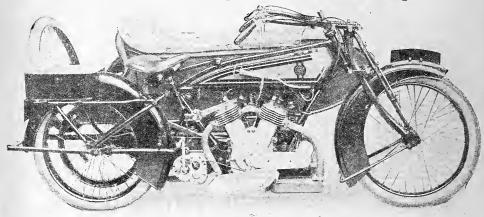

The sight of the pretty little village nestling in the depths of the tree-draped gorge suggested a halt, and enquiries were made for the mountain road over to

A New Twin with an Old Name.

The Rex Co, reintroduce a Big Twin Model with 940 cc, Engine.

The twin Rex sidecar outfit, which was entered for the London-Exeter Christmas Trial

THOSE who have only joined the motor cyclists' fraternity during the past few years find it difficult to realise that about fifteen years ago the motor cycle was threatened with extinction. It had been tried by a comparatively large number of makers, but in its early state of development it was found wanting, and was dropped out of their programmes. A small "handfull" of makers

A small "handful" of makers and The Motor Cycle, however, had sufficient confidence to "carry on" against obstacles and prejudice. Among these firms the Rex Motor Manufacturing Cowas one of the bæk known, and, although it made both singles and twins, it is for the latter type that the company is better known by latter day motor cyclists. Following the introduction of the Rex sidecar "single." the oldestablished Coventry firm has now produced a twin on similar lines. It will be appreciated from the

It will be appreciated from the illustration that the new model is a distinct departure from the prewar twin Rex. It is larger all round, is fitted with 28×3in. quickly detachable and interchangeable wheels, and carries a "spare" at the rear of the sidecar hoot.

car hoot.

The engine has a bore and stroke of 80 mm. and 95 mm. respectively, the total capacity being 940 c.c. As in the late

1914 model, the lower part of the cylinder barrels is enclosed by the upper part of the cylinder trank case, between which and the cylinder walls there are annular chambers which are always full of oil. Two channels are cut in the walls of each cylinder, through which oil passes to the cylinders, the surplus dripping into the crank-case, lubricating all other points by splash system and passing into the timing case to lubricate the plain hearings carry

ing the two half-time wheels, from one of which the drive for the magneto is taken.

Each cam wheel has two cams, operating two pairs of rockers, those for the exhaust valves being supported on a centrally disposed shaft, and the inlets on separate shafts at each side. Enclosed exhaust valve lifting mechanism consists of two flat levers, which engage with lips

The Rex 1920 twin engine, which is similar to the power unit introduced late in 1914, but distinct from the type used in 1913-14.

on to rockers. They are carried on a shaft below that supporting the rockers, and extend through the timing case, where a lever is fitted and operated by a Bowden cable.

As will be seen from the illustration of the engine, provision is made for enclosing the valve stems and springs, a feature which makes for neatness, and the cylinders are held from the head by means of long swivel botts.

Roller bearings are used for the main bearings and big ends, the connecting rods being slightly offset.

The silencer pipes are of flexible tubing, bending in clean sweeps to a flat metal expansion chamber of large size, which is carried under the magneto platform. From the engine to the Sturmey-Archer

From the engine to the Sturmey-Archer three-speed gear box the drive is by chain enclosed in a cast alu-

chain enclosed in a cast aluminium case, thence the drive is by belt to a separately built pulley wheel supported on its own ball bearing, which remains in position when the rear wheel is removed for tyre repairs.

All wheels are well mudguarded, and as an "extra" a pair of patented detachable winter guards is supplied for affixing to the valances of the front wheel guard. These increase the width of the guard by 400%, and while probably in the hottest weather of the summer they may screen the engine, in the winter months they should protect the driver from mud spray without detriment to the running of the engine.

without detriment to the running of the engine.

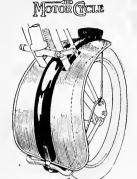

Most of the constructural features of the "single" are retained in this new model. which, incidentally, will be known as Model 66. The brake pedal-shaft and the steering head have large lubricators, and the sidecar lugs are integral with the frame. The tank is of large exactive and in addition to the

are integral with the frame. The tank is of large capacity, and, in addition to the drip feed lubricator, is fitted with an outside oil pump placed on the side of the tank further to the rear, and more horizontally disposed than is usual. The handle-bars are adjustable, the rear brake has a parallel action, and the equipment includes aluminium footboards, Brampton Bitlex forks, and large combined tool box and carrier.

A New Twin with an Old Name,-

Plated parts are conspicuous by their ablack, as are most of the littings. The Rex cantilever spring saddle-pillar is fitted as on the single-cylinder model, which it also follows as regards colour scheme, the tank beine black with murde namels.

tank being black with purple panels. The sidecar is the same as fitted to the 4 h.p. model, and which created a very favourable impression at the Show. Cantilever springing is used, and the wheel is supported on both sides, the enter member being a large oval tube, which is hinged to facilitate removal of the wheel. The quality and finish all round are exceptionally good, and from an inspection of a number of both models in course of erection we should say that "show finish" is standard finish with all machines now turned out by the reorganised Rex Co. The price of the outfit, complete with spare wheel and tyre, is £180.

Something new in mudguarding. The Rex detachable winter guards for the front

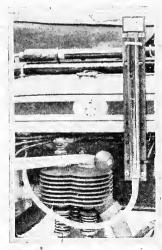

A SIMPLE-FORM OF PETROL CONSUMPTION TEST.

O NE of the facts which the average motor cyclist is most auxious to know is how much petrol his motor cycle is consuming. There are may ways of finding this out; for instance, starting on an empty tank and running the machine to a standstill on a measured quantity, or starting with a brim full tank, running a certain distance, and measuring the quantity of fuel required to reach the original level. In the first case, it is an exceedingly tedious job to empty the petrol tank, and in the second case, when a tank is filled as full as possible; the spilling of a certain amount of fuel from the filler

a certain amount of their from the mercap cannot well be helped.

That most ingenious inventor, Dr. A.

Low, has devised a simple and
effective scheme for quickly ascertaining
the consumption of a motor bicycle over
a short distance, by means of which useful data can be rapidly obtained. It
consists of a small glass measure, protected by a brass tube, through which
the glass is visible, the glass being graduated in cubic centimetres. It is provided with an elastic, the ends of which
have hooks attached, and this enables
the instrument to be clipped to the sides
of the tank in a very few seconds. It
is only necessary then to undo one of
the unions, and connect the pipe to the
carburetter. A start is made, preferably
opposite a milestone or with the speedometer at zero, and a run of a mile is
then taken. At the end of the mile the

The petrol consumption indicator designed by Dr. A. M. Low, fitted on a Triumph motor cycle.

reading of the gauge is taken, and this, divided into the number of cubic centimetres to a gallon (which is 4,546), gives the fuel consumption of the machine in nules per gallon.

THE 1920 TOURIST TROPHY RACE.

Two Races-500 c.c. and Junior T.T.-which will include a Lightweight Event for "The Motor Cycle" Trophy.

I Thas now been definitely decided that the T.T. Races shall be held in the Isle of Man on the 15th and 17th of June. The Senior Race will be for motor bicycles with engines not exceeding 500 c.c., and the Junior Race in two classes—(1) for motor cycles with engines not exceeding 350 c.c., and (2) for motor cycles with engines not exceeding 350 c.c., and (2)

The latter class will compete for The Motor Cycle lightweight trophy. This cup is to be won outright, and manufacturers will not be bound to place on the market machines of the type which have competed for the trophy. There is no limitation as to maximum weight, as it is considered that manufacturers of motor bicycles competing for this trophy will, for their own sakes, not make the machines heavier than they can possibly help.

For the same reason one would assume that there would be no minimum weight limit, yet this will be fixed at 88 lb., presumably to prevent freak designs,

such as those bygone French racers which eventually brought about the F.I.C.M. weight minimums for both senior and junior races (132½ and 110½ lb., respectively). Nevertheless, such limits tend to discourage the very aims for which the lightweight prize is offered, i.e., to produce the ultra-lightweight machine. However, even 88 lb. lightweight machine. However, even 88 lb. lightweight modelines weighing, say, 50 lb., it will prove that weight minimums in this year's T.T. will act as a brake to prevent too rapid development. Years ago, French designers produced comparatively high-powered machines weighing around 100 lb., and we have progressed in the last few years alike in engine, frame, and spring fork design, if not in weight reduction, and everything considered, one must agree that 88 lb. as a minimum is scarcely low enough. In any case, we do not expect to see any T.T. entrant for 1920 lighter than 100 lb.

ILKLEY M.C. & L.C.C. DINNER.

THE first post-war annual dinner and prize distribution of the above ciub was held on Friday, December 19th, and it proved a most successful function.

and it proved a most successful function. Much sympathy was expressed for Capt. J. Norman Longfield, the president and founder of the club, owing to his temporary loss of voice resulting from the recurrence of the ill-effects of a gas attack. His speech was consequently read for him, and was greeted with great enthusiasm. In his speech he said that in arranging an open trial such as this club proposed to hold in 1920, it was absolutely necessary that the event should be perfectly organised. He suggested that the only possible method of securing this desirable end was to exclude their own club members from the competition, and thus ensure the full strength of the club for organisation, marshalling, and observation. This project would also eliminate the possibility

of their own riders gaining awards at the expense of those who were less familiar with the district and who consequently competed at a disadvantage. Many other clubs given to the organisation of open trials might well give some consideration to these points. Amongst other speeches during the evening were those by Lieut-Commander Pierce, on behalf of the A.C.U., Mr. H. W. Sellers (secretary), and Mr. D. H. Smith *The Motor Cycle*.

One outstanding feature of the prize distribution was the fact that the whole of the awards, both trade and amateur, in the recent Scott Trial were secured by members of the Ilkley club.

A successful year is thus closed, and the members are keenly anticipating the holding of one of the limited number of open trials of 1920, the club having been provisionally granted a permit by the A.C.U.

10,000 MILES ON BENZOLE.

In this Article the Author gives his Experience with Benzole, including 3,300 Miles covered while he was driving the Tender accompanying the A.A. Benzole Test Machine.

N January 2nd, 1919, I took delivery of my 4 h.p. countershaft Triumph sidecar, and at once set to work to tune her for speed work on benzole. After trying various size jets I found that a fairly large one was necessary, but this did not mean heavy consumption, as, when the correct size was found, I could get 85 m.p.g. for ordinary touring, or for speed work on long journeys, such as Yarmouth - Coventry (165 miles in five hours, average 33 m.p.h.), 55 m.p.g. These results were obtained with adult and juvenile passengers in the sidecar as well as luggage.

I have found that a long extension tube on the carburetter air-intake is most useful. At no time has

it been necessary to touch the air-lever; therefore, the carburetter is practically automatic, the air-lever being used for starting only. More oil must be used when using benzole, also single-point plugs (such as K.L.G., or by breaking off two of the three on a Lodge). There is no injury to any part of the engine or tank. The engine gets slightly hotter than when using No. 1 petrol, but I did not find that this was at all detrimental; as I have stated before, I used more oil. I was invited to pilot the tender machine through the 5,000 miles National Benzole Test. Starting from Coventry on September 11th, with the carburetters set as above, we reached Fanum House, London—the Headquarters of the A.A.—with benzole consumption at 105 m.p.g., oil consumption at 300 m.p.qt.

Glasgow was left on Monday, September 15th, by a route through Edinburgh, via Shott's Kirk and Mid Calder, Linlithgow, Falkirk, then north through Stirling and Duiblane to Perth: a good five days' work with a total mileage of 673. The next day we took the road along the Carse o'Gourie to Dundee, and then through Montrose, Stonehaven, to Aberdeen, followed by a run along the Dee Valley to Braemar Mirc, where very bad weather was experienced, including strong head winds, rain, and some snow. On Thursday, September 19th (the ninth day of the test), a run was taken to Largs and Ayr, where the first 1,000 miles were ticked off.

From Braemar we went on to Perth, along the Spital at Glenshee, over the summit, and down Devil's Elbow, with its gradient of τ in 3/2. Next day we journeyed on to Glessow. an uneverthely are

on to Glasgow: an uneventful run.
Glasgow to Sedburgh, 191 miles. Back in dear old England again, I felt nearer home now. This

Mr C. R. Little, the writer of the accompanying article, on his 4 h.p. Triumph, which acted as tender for over 3,000 miles of the A.A. Benzole Test.

was one of the most thrilling rides I ever experienced. It was a T.T. race from the time we started (9 a.m.) until Sedburgh was reached at 10.30 p.m.: 191 miles in 13½ hours' hard riding, averaging over 82 m.p.g. The day following we had eighteen miles over the next pass to Shap, and this in the dark, with narrow mountain roads, straying cattle, and steep pimples: so steep that when one reached the top the head light was piercing the heavens, showing nothing of the road one wished to traverse. On these roads, there are small white railings to prevent one from falling umpteen hundred feet in the blackness.

On Sunday, September 21st, we arrived at Leeds, our centre for three days,

whence we made *détairs* to Scarborough, Bridlington, Manchester, Preston, etc. This completed the first half of the journey—2,500 miles in eighteen days: some ride!

When the engines were taken down and decarbonised by Mr. R. S. Fox, A.M.I.A.E., M.J.I.E., the carbon deposit was just enough to fill a dessert spoon.

Few Troubles.

I believe there were three or four slightly burnt valves during the whole trip. This was due chiefly to the very strong head winds. On one occasion, the observer for the day estimated the head wind at 45 m.p.h. This was one of the worst days we experienced, as, passing between the mountains, the wind was so strong that second gear had to be engaged for downhill work. The M-L magnetos behaved splendidly, only once giving trouble. This was on the test machine, but was due to over caution, as Mr. Harold Finch, who drove this machine, to make sure that water would not run down the high-tension wire, bound insulation tape round the base. Instead of having the desired effect, water was caught by this tape, from which it reached the interior of the magneto. Both machines ran the whole trip without any adjustment. The Easting windscreens were a boon to the observers, and, incidentally, to the machines, as when adjusted correctly they act as wind-cutters.

In summarising the results of this test, and the total running of 10,000 miles, I am convinced that, when the carburetter is tuned correctly, one cannot ride on anything better than N.B.A. benzole, and we should do all we can to encourage its production.

A Well-earned Award.

When J. E. Walker was formally presented at Ikkey recently with the cup for the best amateur performance in the 1919 Scott Trial, he mentioned that he covered the arduous mountainous course, and surmounted almost impossible obstacles on a Scott with standard gear ratios of 4.2 and 7.5. — In view of the fact that the rider himself weighs thirteen stone, the performance was indeed creditable to both man and machine.

Pity the Poor Editor.

On several occasions recently we have been asked by readers to trace the date of manufacture of a motor cycle by the engine number. While our knowledge of motor cycles is abso-

Intely unrivalled, we regret we have to state that we have no records of every engine of every make which has ever been turned out. It is useless, therefore, to address these requests otherwise than to the actual makers, who, in response to a reply paid telegram will, in most cases, supply the necessary information with all promptitude. In fact, this is a procedure we recommend our readers to adopt before purchasing any second-hand machine about the date of which they are in doubt.

Capt. Sir John Alcock, K.B.E., D.S.C.— Motor Cyclist—Airman.

After living but six months to enjoy honours earned by his great Atlantic flight, Sir John Alcock, D.S.C., passed away on the 19th ult., through severe injuries received in a crash in France. Sir John Alcock was only twenty-seven years of age—sufficiently old to have been an enthusiastic motor cyclist before the war, sufficiently young to have that spirit and courage which an Atlantic flight demanded.

We were with him but a day or so before he left England on his last flight, and the topic of conversation was mainly motor cycles and cars. He was a keen rider of Douglas machines, and was the first to ride an overhead valve Douglas at Brookhards. Flying was his profession—the self-propelled road vehicles his hobby. The day he was knighted he

journeyed straight to Bristol, which city was entertaining the A.C.U. Committee. Despite the fact that the visit was unexpected by the municipal authorities, Bristol would have lionised him, but he would have none of it, and so modest was he that, when the crowd at Ashton Court Park pressed about him to congratulate him, his embarrassment was positively painful to see. He had not known that hundreds were waiting to see him—he had gone to Bristol to escape a civic reception, and had anticipated a quiet weekend with his friend, Mr. S. L. Bailey, of Douglas Motors. Of his great achievement he would say nothing—there was nothing to say, he would reiterate, and few, indeed, were his friends who learned details of his flight from U.S.A. to Clifden (Ireland) in 16h. 12m. It was for this pioneer achievement that he and his companion, Lt. A. Whitten Brown, were knighted.

During the war Sir John served in the

During the war Sir John served in the R.N.A.S., became chief instructor of the Aeronautic Squadron, and served on the Turkish Front. In 1917, while on a bombing raid, he was forced down, and remained a prisoner until Christmas, 1918. He received the D.S.C. for his services.

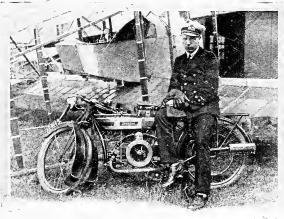

When he crashed, he was flying to an aircraft exhibition at Paris. He encountered fog, and on this account flew low, fooling a tree near Cootévrard, thirty miles from Rouen. He was taken to a military hospital,

where it was found that he had sustained a fractured skull,

With his death passes one more British motor cyclist who has added emphasis to the fact that the motor cycle breeds courage and that the characterises the modern young Englishman. That the majority of youths of to-day are in the motor cycle movement augurs well for the future.

Those of our readers (if any) who did not perceive that the decimal point placed in the oil consumption figure of 1,166 was a printer's error m nst have thought that the oil consumption was unduly high. The value of a comma is well illustrated.

The late Capt. Sir John Alcock, D.S.C., who was killed whilst flying to the Paris Aero Show. He, with Lt. Sir A. Whitten Brown, made the first direct flight across the Atlantic. When photographed with his overhead valve Douglas he was in the R.N.A.S.

MOTOR (YCLE

Brussels Show.

The Brussels Show of cycles and motor cycles will be held in the Palais d'Egmont, the opening day being February 16th.

Motor Cycle Competitions.

We are informed that the list of pro-We are informed that the list of proposed competitions recently issued by the Auto-Cycle Union has been slightly altered. The Birmingham M.C.C. reliability trial will take place on April 24th, and the Midland C. and A.C. trial on July 10th. The Sutton Coldfield event has been definitely fixed for Saturday, February 28th.

The Club Champions' "At-home."

The Club Champions' "At-home."

Now that the Coventry and Warwick-shire Motor Club has "taken delivery" of The Motor Cycle Challenge Cup, won in the M.C.C inter-team trial of 1919, the winning team, consisting of S. Wright (captain), R. B. Ewens, W. Brandish, H. Finch, B. Ryceroft, and F. G. Edmond, are to be entertained at a little function at Coleshill on the 3rd inst. Mr. John V. Pugh, J.P., a past president of the Coventry and Warwickshire Motor Club, has kindly presented the club with a cabinet to accommodate the trophy, which inciaccommodate the trophy, which incidentally has attained considerably enhanced value on account of the record price of silver at the present time.

Scheme to Help Bart's.

Coulson's excellent example

In connection with the great efforts, being made to provide St. Bartholomew's Hospital with funds, Mr. F. Aslett Coulson—the maker of Coulson motor cycles—is organising a scheme to obtain the gift of a number of new motor cycles from manufacturers, which will be put up for auction by Mr. George Robey, the well-known comedian, and now almost as well known for his activities in charitable well known for his activities in charitable schemes. Mr. Coulson, so far, has one machine—his own—but by the time our next issue is printed we hope he will have others. The motor cycle industry has always shown generosity where charity is concerned, and we have no doubt that Mr.

Thanks

The Motor Cycle wishes to thank the many readers who sent Christmas cards and kind wishes,

Greetings.

A Happy New Year to all motor cyclists, past, present, and future. May your mounts go well, and may we meet and enjoy many competitions together during 1920.

Another Anglo-American Car.

Last week The Autocar made the exclusive announcement of the coming of a British Overland car. An impending amalgamation of Anglo-American car inamaigamation of Angio-American car in-terests is imminent, the new company to be known as the Willys Overland Crossley Co., which million pound con-cern will take over the huge works at Heaton Chapel, Manchester, for the pro-duction of the Overland car in this country.

N.E.A.A. Motor Cycle Board.

A meeting of the Motor Cycle Board of the North Eastern Antomobile Association was held at Newcastle on December 23rd. Mr. Q. A. Nicol, O.B.E., occupied the chair, and there was a representative attendance.

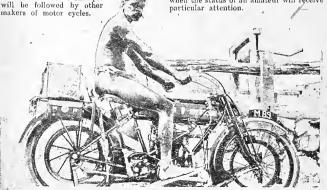

It was decided to support the proposed "Olympia" meet at Richmond on Good Friday. The Chairman said that manufacturers would be invited to send examples of their latest machines for exhibition to the meet, and the Grimshawe shield—an award for a competition suspended since 1915—will again be offered for competition by affiliated clubs, the proportion of mem-bers present and the mileage covered to

be the basis of the award.

Messrs. Nichol, Raper, Walton, and
Turvey were appointed as a sub-committee to prepare a dozen routes for the approval of the Auto Cycle Union Committee for the 1920 Six Days Trial in July next, when Newcastle will be the centre. An average of about 150 miles for each

day's run was suggested.

Messrs. Nicol, Raper, Broadway, and
Eorster were appointed to go into the
question of rules and competition rules, when the status of an amateur will receive

NOT IN THE LONDON-EXETER! This Australian native's riding attire, in contrast with the entrants of the trial, has the great advantage of simplicity. His mount is a B.S.A.

Future Taxation.

The Autocar says: "We do not think we are disclosing any secrets when we say that the system most favoured by the Motor Legislation Committee is to place the whole burden of taxation on the motor spirit consumed.

the motor spirit consumed."

The question of motor taxation is under consideration by the Government. Several alternatives to the present system are mooted Rumour says that Mr. Bonar Law strongly objects to the continuation of the petrol tax in its present or any other form, on account of the abuse to which it is subject, and the expense of administering the tax.

International Motor Cyclists' Conference.

A meeting of the Fédération Inter-nationale des Clubs Motocyclists has been arranged for Thursday, January 22nd, at the Royal Antomobile Club, Pall Mall, London. S.W.I. This meet-ing will be attended by representatives of the national motor cycling clubs of France. Belgium. Holland. Denmark. France, Belgium, Holland, Denmark, Switzerland, Italy, Great Britain, and the United States. Among the import-ant business to be dealt with at this meeting is that of confirming the altera-tion of the 1920 International Trial at Grenoble, from July 29th to August 1st; and to decide upon the country in which the 1921 Trial will be held. The regulations regarding International records will also come up for consideration, and will also come up for consideration, and there will be the required annual election and re-election of officers of the Federation. Mr. T. W. Longhborough, A.M. I.A.E., the secretary of the A.C.U., is secretary of the International body, and would be glad to give any further information about the conference to those interested, on application to him at A.C.U. Headquarters, 83, Pall Mall, London, S.W.1.

Paris-Nice Trial.

It has been decided that the Paris-Nice run, which commences on February 10th, shall be in in four stages as follows:

Paris to Dijon ... 193 miles Dijon to Lyons ... 124 ,, Lyons to Marseilles ... 193 ,, Marseilles to Nice ... 140

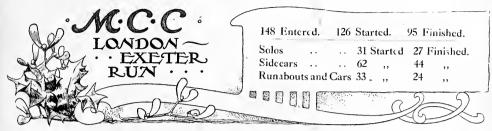

Total ... * ... 650 miles

The average speed to be maintained is 183 m.p.h. with a tolerance of ten minutes each way and fifteen minutes for 250 c.c. solo and 350 c.c. sidecar machines. Beyond these tolerances later or earlier arrivals will be penalised one point per minute.

In addition to the open controls, there probably will be one or more secret controls an each stage of the journey, when penalties of one point per minute will be inflicted on those who are five minutes ahead or ten minutes behind their official time.

Copies of the rules and entry forms for this competition may be obtained from the Editor, The Motor Cyrle, 20, Tudor Street, London, E.C.4, English motor cyclists who wish to enter should note that entries at ordinary

fees close on January 15th, and on January 30th at double fees. Butries should be sent to M. G. Sweerts, Morcogolisme, 1, Cité Paradis (Xe), Paris.

ADVERSE CONDITIONS FOR THE CLASSIC CHRISTMAS RUN.

A LTHOUGH the weather conditions on the morning of the fifth winter club run from London to Exeter and back, organised by the Motor Cycling Club, inspired great hopes of a pleasant run amongst the 148 riders competing in the trial, the gods favoured none. A slow sweeping drizzle set in at about 2,30 p.m., to remain throughout the night of the 26-27th December, and create what was probably one of the most severe tests of both machine and rider yet experienced by the club.

As is always the rule, prior to a severe trial of this kind, the word weather trembled on the lips of all, and sometimes, perhaps, with the more experienced sportsmen, preceded by an adjective suitable to the prevailing conditions, combined with the difficulties of effecting the minute final adjustments in the blinding rain.

Many hours before the scheduled start at 8 p.m., active preparations for the might's run were in progress. At short intervals, a blaze of light could be seen approaching the wet and steaming throng bending over the glistening machines,

and as the latest comer brought his mount to a standstill, amid the roar of exhausts and clouds of blue smoke, it was impossible to recognise the "oil-skinned" and "son'-westered" driver who proceeded to haul from within the closely-hooded and screened "sidecar numerous coats, wraps, and oilsheets in the endeavour to locate his more fortunate passenger, who, by his appearance, might well be described as a mummy grotesquely emerging from its case.

In Many and Various Garments.

Regardless of the miserable conditions under which the 'plucky riders carried out the final preparations in readiness for their self-imposed task, the noise of the many machines was drowned in peal after peal of hoarse laughter from the throats of the dripping riders as each newcomer who joined the happy throng revealed an even more grotesque, yet amusing, figure by his method of defying the wind and storm.

Amusing variations in riding kit were also to be witnessed at the Bridge Hotel. One giant who, equipped in com-

plete flying kit, entered with his passenger to partake of a final meal, commenced to perform numerous Houdini stunts in the endeavour to remove his six seanless coverings, and, after tying himself in a complete knot, had to be assisted by his passenger, who, to the intense surprise of the spectators of this currious cult, removed an oilskin helmet, from which coils of hair fell around two femiline

Two powerful outfits—a Matchless-and an Indian—near Salisbury.

shoulders. The number of lady passengers, however, who braved the ordeal emphasised the wonderful enthusiasm displayed by the fair sex.

Lighting Troubles.

Returning again to the cluster of machines which had now filled the sheltered garage and occupied the large square adjoined thereto, which, brilliantly illuminated by a friendly petrol supply lorry, was a scene of great activity.

A rider of a Coulson B, whose amusing headgear much resembled the familiar head dress of the Chinese labour corps, was at a loss to know why six hands are required to dissect a carburetter, clean a lamp jet, and stir up a D.A. cylinder, which operations had to be completed in three minutes.

Electrical equipment such as could be seen on the larger sidecar outfits was, of course, the envy of the less fortunate competitors, whose acetylene generators and other sources of illumination sometimes refused to function at the last moment.

A quarter of an hour from the start no signs of an abatement in the weather seemed possible. Quite a large crowd, however, had assembled along the line of machines now drawn up in readiness for

A scene in the hotel yard at Salisbury A rider of a Douglas outfit about to take the road.

Light cars are in evidence.

A James outfit near Salisbury. Leg guards were fully appreciated on what proved a wet and muddy journey

the start from the Bridge Hotel to give the plucky riders a final cheer as they sped on their 154 mile journey through the blinding storm to Exeter.

126 of the entrants got away well, comparatively little misunderstanding with the timekeeper being observed.

Considerable excitement was displayed as the two 3 h.p. A.B.C. machines sped out of sight with a humming roar; the second of these, piloted by J. Emerson, hauling a sidecar. Following this machine was entered a Whippet scooter. The excited crowd, however, were to be disappointed, as the enterprising entrant of this little machine, when signalled to start, was luxuriously seated in a Chapman car.

The 310 mile route from Staines lay through Basingstoke, at which town petrol and oil could be purchased, to Salisbury, the first check. Leaving the White Hart Hotel, Salisbury, the road lay through Yeovil, where much appreciated refreshment for both rider and machine could be obtained, and on through Chard, the commencement of the non-stop test, ascending to Chard Hill two, where the successful competitors were required to sign the checking sheet.

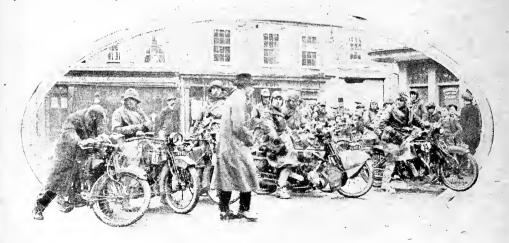

Still ascending through Yarcombe, the route lay straight through Honiton to-Exeter. The return journey from the Bude Hotel, Exeter, led through Sidford, the return non-stop test, up Trow Hill top, where the checkers' sheet had again to be signed, and-following through to Salisbury, the return route, through Basingstoke and Bagshot, terminated at the starting nost at Staines.

Of the 126 starters, 95 tired and mudbespattered heroes returned, some less mudguards and other equipment, petrol tanks bleached by the foaming acetylene of the previous hight's struggle; others so exhausted that many willing hands pushed the mud-clogged machine away. The trial had been a severe one, in the opinion of most of the competitors. Only one serious mishap, however, was reported, and the unfortunate riders were Mr. W. E. Line and his passenger.

E. H. Newnham (8 New Imperial), wearing a warm woolly helmet, going well on the outskirts of Salisbury.

The organisation of the trial was excellent, and in view of the adverse conditions under which it was conducted, the officiating members of the M.C.C. are to be congratulated.

At Blandford the scene was animated. Here is seen a group of competitors ready to take the long road again.

MOTOR (TCLE

A COMPETITOR (J. A. MASTERS) DESCRIBES THE RUN AS A STRENUOUS WINTER JOY-RIDE.

Sing hey! for the West,
The land of the free,
We've run down to breakfast,
We'll be home to tea.

MY own sentiments were quite in accord with my passenger's when in a hearty voice he submitted the above gem for my approval as we rolled quietly out of Exeter on the return stage of our Christmas joy-ride. And certainly

Fell-Smith and his Harley-Davidson outfit near Pentridge.

we were in a more cheerful frame of mind than we were when we let in the clutch at 8.26 p.m. at Staines on the previous day.

Staines at its best has never charmed me, but Staines on Boxing Night was the last word in discomfort. Torrents

Triumph riders on the Dorchester road. Note the improvised leg guards

of rain—the stendy, good-for-the-crops variety—crowds of dripping riders, no food at the hotel—and three hours to wait! 'And yet, in spite of all, the prevalent note was one of cheerful optimism which Jupiter Pluvius entirely failed to efface.

The opinions of the onlookers were, as usual, very amusing. Whilst half of them thought that we deserved the V.C., the other half wondered, quite audibly, why some 250 apparently sane individuals should leave their, presumably, happy Christmas firesides for a mad ride of over 300 miles through the pouring rain. My passenger, who is associated with the Metropolitan Asylums Board, solemnly assured me that he knew of men who had been "certified" for actions far less suspicious than ours!

Getting well away at 8.26 p.m.; we kept a steady pace through Bagshot, Basingstoke, and Andover, arriving at the

last-mentioned town with ten minutes in hand. A halt for refreshments enabled us to note the lighting equipment of the steady stream of riders who passed us meanwhile. The outstanding feature in this respect was the poer service given by the ordinary acetylene generator lamp set. Time after time we passed riders in trouble with their lighting arrangements, whilst the illumination with which some of them rode through says volumes for their ability to see in the dark. Electrically equipped sidecar combinations were greatly in evidence and appeared to give no trouble whatever.

Over Salisbury Plain.

A fairly strong wind, a good road, and a temporary cessation of the rain, made the ride across the plain to Salisbury quite enjoyable. The majority appeared to be well on time here with nething eventful to relate. Beyond Salisbury the road began to get heavy, whilst nearing

A scene at the Salisbury check. A moment when Sunbeams-machines, of course !- were much in evidence.

M.C.C. London-Exeter Run.-

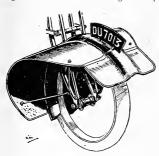

Sherborne a length of about 200 yards was entirely submerged.

From Yeo'il to Honiton must have been a nightmare for the solo riders, judging from the desperate way in which they clung to the crown of the road. It was certainly bad enough steering a heavy sidecar outfit.

Chard Hill was in very fair condition and did not appear to give much trouble. A halt for a smoke and a stretch at the top of Yarcombe gave us an excuse for a little fast diving right into Exeter, where we arrived seven minutes early.

minutes early.

Apart from tyre troubles and lighting failures, very little was heard of mishaps on the outward journey, although at Yeevil we certainly saw one rider of a big twin sidecar outfit listening carefully

An extremely wide mudguard is fitted to the front wheel of the 1920 6-8 h.p. Rex.

to the running of his engine, which was emitting a musical jingle consistent with the theory that one expert put forth, that it had a bunch of keys on top of the piston!

The Secret Check on the Return Trip.

A somewhat depressing dawn began to break as we neared Trow Hill. Having taken the precaution of getting past everyone in sight, we had a clear run. Down into second gear, and then quietly into first as the first corner was reached, we had slithered round both corners and were signing the checkers' sheet at the top of the hill before we quite realised that it was certainly a tough proposition for any but a powerful mount.

With a following wind and a bright sky, the run along the South Devon coast was quite enjoyable, and after negotiating the hilly road to Dorchester it was somewhat of a problem to keep within the fifteen minutes' early regulation. Indeed, three miles before Blandford a secret check which Mr. Robert Head was operating must have jeopardised a number of gold medals.

A quick sum in mental arithmetic enabled us to prove to our own satisfaction that we were exactly twelve minutes early, so, breathing freely once more, we proceeded at a sober pace across the plain to Satisbury, the last cight miles being covered in a dreuching rain.

The ride from Salisbury to the finish was the most monotonous part of the journey. Naturally a little weary, the

V. Olsson (New Imperial), a competitor who performed well in the big pre-war trials.

knowledge that we had to take 3½ hours for a distance that we usually do under 2½ hours was not comforting. However, Staines was reached at last, two minutes early—we really hadn't the patience to dawdle away those 120 seconds and swank in dead on time! An absolutely no trouble run without touching spanner or pump, and the Harley running better than ever at the finish. Yes, after all, it certainly was a joy-ride for such as did not suffer from punctures or lamp troubles.

REX MUNDY, WHO HAS COMPETED IN ALL LONDON-EXETER TRIALS, DESCRIBES THE RUN.

THIS year's run was my fith London-Exeter, and I left Staines at 8.56 p.m. with F. W. Carryer, a welf-known trials competitor. As protection against the rain I put on a leather flying cap, two mufflers, and a leather coat. The combination effectively kept me dry. The rain stopped at Salisbury.

Soon after the start many combinations were passed on the roadside apparently in trouble. C. A. H. Mason on a Morris-Cowley was giving a miniature firework

display from his exhaust pipe, emitting showers of red-hot carbon. Before reaching Basingstoke my head lights went right down, but by switching off lights and following another competitor I was able to recharge my accumulator from the dynamo, so that I could obtain a light for passing through villages, etc. In this way we crossed Salisbury Plain, driving entirely by W. Cooper's head lights. This competitor was driving a new Morris-Cowley fitted with a sporting body, the engine of which appeared to be remarkably flexible and possessing a good turn of speed.

Driving Without Lights.

After leaving Salisbury, where the catering arrangements at the White Hart Hotel were excellent, we missed the left-hand turn about 3½ miles out, as did many others. After about five miles I decided to turn round, and soon after doing so we met Clifford Finch on his G.N. I called upon him to stop, and we returned together on to the correct route. We soon caught up a bunch of route. We soon caught up a bunch of cars, when my lamps again went down, and my passenger discovered that the dynamo was not charging. I did not know what to do. Should we continue by means of other people's lights or stop and investigate the cause of the trouble? If we stopped it meant probably being left alone, and by continuing we might lose our dynamo belt if it had broken and dropped into the undershield. I decided, however, to stop, when I found that the belt had badly stretched. After taking out half a link we pushed on and caught up J. Hoult on a Matchless combination, whom we again had to follow with our lamps switched off. At Yeovil, after filling up with National benzole, I managed to obtain a pocket flash lamp from P. W. Moffat. It was now necessary for me to save my lights for Chard Hill, which had to be climbed non-stop. Entering Chard, we passed the Eric-Campbell, but did not sec this car again during the trial. The ascent of Chard was child's play and I signed the checking sheet well within time limits.

Competitors snugly ensconced in the runabouts were envied when the heavy downpour of rain occurred. This little four-wheeler is a G.N. passing through Middle Wallop.

MOTOR CYCLE

M.C.C. London-Exeter Run.

We continued on to Yarcombe Hill, where an eight-cylinder Talbot-Darracq car passed us climbing well. Stead on the IO h.p. A.C. also made an excellent ascent. The arrangements at the Excter control were not too good, two or three marshals getting quite annoyed because we did not put our car exactly where instructed to do so, but as they all wanted the car in a different position it was quite impossible to please them all. Poor "Billy" Cooper here wanted to remove his sparking plugs, but as this could not be done without a box spanner he was in sore distress, not having the requisite size. I gave him a hand, and eventually discovered that the rocking arm of his Magdyno had stuck owing to a swollen fibre hush. Having put him right, we discovered that only twenty minutes were left for breakfast, so we all adjourned, with speed, to the Bude Hotel, where, thanks to their very excellent service, no time was lost in securing something to eat and drink. In leaving the official garage we lost valuable time in being stopped by other people who were not due to leave. We, however, after much horn blowing, managed to get going, and made an excellent run to the foot of Trow Hill, where the second non-stop section commenced. The hill itself presented no difficulty to my Wilton, which I took up steadily without using full throttle. Just round the left-hand corner we passed C. A. H. Mason, who had come to rest on his Morris-Cowley. Ernest Herring, pie war seeretary of the Bournemonth and District M.C.C., checked us at the top of this hill well on time. We made a good run through Lyme Regis to within about twenty miles of Salisbury, where rain commenced to fall in torrents, so we put up the hood, but only for a few miles, as the rain ceased

Homeward Bound

An uneventful run now brought us through Andover and Whitchurch. For some distance we were accompanied by J. A. Ncwman on his 3½ Sunbeam. He had been marshalling at the Salisbury check. Just before reaching

Basingstoke, Newman suggested that we should stop at a small country inn. It was either after or before hours, so I decided to treat my radiator to some water, which I obtained from the inn. The run this 'year was undoubtedly

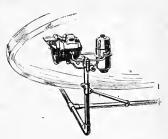

The run this year was undoubtedly stiff, particularly so for the solo people, the roads being so very rutty. Well, it is all over, and, although hard work, I look forward to the next, in which I hope to compete. In conclusion, I would like to congratultee B, Alan Hill on the very excellent way in which the event was organised.

"WEATHER AND ROAD CONDITIONS BAD," SAYS R. CREAK DAVIS

SUPPOSE the chief topic of comment in connection with this year's London to Exeter Run is the weather, It is a subject upon which much might be written and more said (in words not suitable for so respectable a journal as The Motor Cycle), but for my part I say it might have been worse, and upon occasions it has been worse. Certainly, in the words of Mr. Mantalini, it was demd moist and unpleasant. to the weather the condition of the roads was the most heart-burning subject. Vile is the only word that fits. I gave up trying to steer clear of pot-holes in the hope that in this way I might miss more than I would by deliberate steering, and as nothing shook loose or broke perhaps I was justified in that hope. What was the matter with the surface between Wilton and Yeovil I cannot say, but I never had a sidecar skid about so in all my long experience, and to find that so many solo riders had got through to Exeter was nothing less than marvellous. I heard that on this stretch the official car had more than one escape from finishing in the ditch. Rumours at the start of extensive and deep water splashes no doubt gave some of the new hands food for thought, but fortunately rumour was once more a lying jade, or almost, as no water deeper than a couple of inches was met with. Very different from 1913, when the water was up over my footboards, and the solo machines with belt drive had to be pushed through.

Le Vack (flat twin Harley-Davidson) and another competitor leaving Salisbury

Complete lamp and generator set mounted on handle-bar type fittings and a tubular support at the side of the sidecar body on H. A. Reyre's James and sidecar

The arrowing of the course was most excellent, and the hearty thanks of all of us are due to Messrs. Head and Wells, who were responsible. Perhaps an arrow at the fork for Sidmonth and Sidford would have saved even the Trials Hon. Sec. from trying the delights of Sidmonth. The catering at Salisbury both ways at the White Hart was excellent, and the M.C.C. is to be congratulated upon this, but as to that at Exeter, the less said the better. Considering the large entry, mechanical trouble was almost non-existent. During the night lamps and generators were the most frequent cause of a stop, but if only competitors would fit a gasbag to each lamp and run all lamps off one large generator, I can promise them that lamp trouble will disappear. My own Lucas Magdyno set gave me no trouble at all, and I had all the illumination any reasonable person could want.

AN OBSERVER'S IMPRESSIONS ON TROW HILL.

The majority of the machines climbed very well, but a great deal has to be said for the riders themselves—some were good, and others were not! It required real skill to put up a star performance round the second hairpin after the surface had been well churned up, and more than one failure was attributable to poor driving.

The new 23 h.p. Zenith made a very good climb, and it goes without saying that P. Pike, on his Levis, was one of the star turns. Another excellent climb was that of the 4 h.p. horizontal Harley-Davidson.

B. Alan Hill, with the 3\frac{3}{2} h.p. Scott, had an exciting moment. He started to run backwards, and when be put on the brake the whole outfit reared upon the back wheel, and looked like turning a complete somersault.

The Matchless machines did very well, and came up one after the other in splendid style. The same applies to the 7-9 h.p. Harleys with their large and rather heavy looking sidecars; two of these outfit had disc wheels, and a very smart appearance.

INCIDENTALLY.

It is reported that some of the competitors who signed on at the finish had not completed the course. Such cases will be dealt with by the committee at a later date.

About 20% of the competitors failed on Trow Hill. This high figure is pro-bably accounted for by the heavy roads and adverse conditions.

The official car discovered many riders ahead of time, and had a secret check been instituted at Egham quite a bunch would have been penalised.

The percentage of solo riders who finished was greater than in the car class.

The interest in the run was very noticeable as one neared London; from Bagshot to the finish at about half-mile intervals little groups of motor cyclists had assembled to watch the men go by.

The Indian Scout model was much admired at Salisbury, and was extremely well handled by R. R. Coes.

There seemed to be a minimum of tyre trouble. Only three sufferers were observed between Dorchester and Staines. It is one thing we have to thank the wet for; it does keep the punctures down.

One was struck by the number of new faces among the competitors. The riding of some of the newcomers is open to a little improvement. A London-Exeter or two will soon have the desired effect.

"Blinding" was very prevalent, some men being as much as half-an-hour ahead of time. We understand the secret check between Dorchester and Blandford found a good number.

The popularity of the leather flying cap was very marked. Quite 75% of competitors and passengers were wearing these caps. Flying suits wer also worn. Two men caused much amusement in Salisbury, being adorned in overall flying suits having four huge pockets, two of which were on the knees.

Capt. R. Charlesworth (Zenith) was equipped with a new idea of F. W. Barnes, of the Zenith Co., an extra fitting for the front mudguards of two pieces of waterproof cloth fixed to the waydward stays by backs and area; their mudguard stays by hooks and eyes; their efficiency was proved by the cleanliness of Charlesworth's tank. Considering the run it had been through, one might describe it as spotless.

Of the cycle cars and light cars, the best performance was put up by the G.N.'s, which appeared to roar up Trow Hill as easily as anything. One had the bad luck to be baulked on the second turn, but their whole show was one of the best. The Tamplin nearly failed about one-third of the way up, the engine missing badly, but it picked up again and went up in great style.

Wide valances fitted to the rear mudguard of the 1920 6-8 h.p. Rex.

THE J.E.S. LIGHTWEIGHT.

A Real Miniature with Mechanical Lubrication and Automatic Floatless Carburetter.

DIFFICULTIES in connection with obtaining houses within walking distance of works or office have, added immensely to the already large demand for a genuine lightweight motor cycle. Many, especially those who are past the prime of life, are apt to turn from the obvious solution of the difficulty (the motor cycle) on account of the fact that motor cycles require special mechanical knowledge and are too heavy to move into the available storage space. It must be admitted that this argument has not

The cylinder of the J.E.S., showing air space between valve pocket and body of cylinder.

been without justification in past years, but the objections are being steadily removed by the present influx of light machines and cycle attachments.

machines and cycle attachments.

Perhaps the lightest complete motor cycle at the present moment is the 1½ h.p.

J.E.S., which weighs no more than 76 lb., and is designed throughout with the idea of producing a machine which is simple to handle and free from mechanical troubles.

Throughout the engine the most up-todate practice is employed, and the workmanship is exceptionally fine. There are several very interesting features in the design with which we propose to deal in some detail, as many of them deserve the cousideration of all those interested in motor cycles, whether lightweight or otherwise.

To begin with, the cylinder is a clean easting having a single valve pocket for both inlet and exhaust with a good air space between the pocket and cylinder walls. The inlet valve which is dis-

posed above the exhaust is enclosed with its rocker in an aluminium casting forming part of the inlet pipe, and this unit is readily detachable by unscrewing a ring nut.

With regard to the volume swept by the piston, the engine has a bore and stroke of 55.56 × 60.5 mm. (2\\delta_c \times 2\dag{\tilde{a}}\)in.) giving a piston displacement of 146 c.c. A hollow gudgeon pin is fixed to the H section connecting rod and floats in chilled phosphor-bronze bushes carried in bosses in the light aluminium piston, and

a very ingenious system of lubricating this important part is employed.

When the piston nears the bottom of its travel (i.e., when the crank case pressure is at its highest value) the hollow gudgeon pin uncovers ports in the cylinder walls. One of these ports is in constant communication with the trank case and the other with the timing case, and thence with the atmosphere. Consequently, crank case pressure release takes place through the gudgeon pin, and cool air and oil mist pass through at the bottom of every stroke.

An open-ended crank case houses the

An open-ended crank case houses the crankshaft, the end being closed by a cover plate carrying the crankshaft and outside flywheels. This plate is well registered in the casting, and is secured by screws. It should be mentioned that below are deilled in the flywheels.

holes are drilled in the flywheel so that these screws are easy of access, and, in fact the end plate and crankshaft can be removed in three minutes.

From the above it will be gathered that the crank is of the single bearing overhung type, but a spigot on the end of the crank pin registers in a hole in a fly crank disc, which, in turn, drives the timing gear.

Combined with the crank case casting is an oil sump with a detachable cover plate, and an oil filler in a convenient position. In this sump lies a gear type oil pump, driven by a worm gear from the periphery of the fly crank disc.

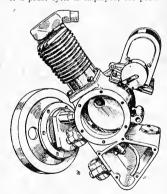

The J E.S. lightweight motor cycle is on pedal cycle lines, but fitted with the motor attachment and spring forks.

The pump forces oil to a constant level trough in the crank case, and thence the working parts are oiled by splash feed. This system is very simple, and cannot get out of order, so that once the sump has been filled the rider is entirely relieved of lubrication worries until it becomes necessary to refill the sump.

Two special lugs on the crank case are used to clip the engine to the down tube of the frame, and a third lug is counceted to the saddle tube by means of links, thus giving both engine and frame an extra point of support.

A special frame somewhat on the lines of a pedal cycle is employed, the pedal-

Power unit with crank case cover removed Observe the disc wheel, rotated by the crank pin, which operates the timing gear and oil pump

ling gear fitted to the bottom bracket in the usual manner. Final transmission from the engine is by Whittle belt. The frame is fitted with Druid type lightweight forks.

A most important feature which must not be forgotten is the floatless automatic carburetter. This is a most simple and ingenious piece of mechanism, and from our own observation, we can say that it functions admirably. This carburetter, though difficult to explain, is very simple in construction, and consists of the following parts.

J.E.S. auxiliary motor set for attachment to existing pedal cycles.

MOTOR CCL

The J.E.S. Lightweight .--

A body is connected to the inlet pipe petrol pipe having a small bole drilled from the petrol union to an inner conical seat. On this seat rests the correspondingly coned face of an inner barrel. This barrel is capable of rotation but not of vertical motion, and in the coned seat is a jet hole with a tapering groove, which registers with the hole already mentioned in the main body. The inner barrel also carries a suffitive valve in the lower part

registers with the hole already mentioned in the main body. The inner barrel also carries a snifting valve in the lower part. Inside again lies a barrel throttle moving vertically and controlled by a Bowden cable. The throttle barrel, which is prevented from rotation by a fixing screw on the outside of the body, is con-

nected to the inner barrel by means of a boss moving in an inclined slot, thus when the throttle is raised so as to give more gas the barrel is slightly rotated and the groove controlling the petrol flow is enlarged, and at the same time increasing engine suction raises the suifting valve and allows more air to pass.

and allows more air to pass.

Mr. Smith gave us an extraordinary demonstration of a standard carburetter on test, and proved that even after a long run at dead slow speed the engine would respond instantly to throttle preping.

on test, and proved that even after a long run at dead slow speed the engine would respond instantly to throttle opening. The J.E.S. engine set can be supplied for the conversion of a pedal cycle at twenty-three guineas, but it must be understood that slight structural alterations to the frame will be necessary; the complete mount, with 26×13 in tyres, costs thirty-eight guineas.

Perhaps our one criticism of this practical little vehicle is that it follows cycle lines rather too closely from the point of view of appearance, and this may be answered by the fact that the extra weight and cost which would be necessary to replace the pedalling gear by a gear box or larger engine would spoil the proposition.

In conclusion, our readers should remember that the J.E.S. has ten years' experience to back it, and that the latest model is further advanced as regards power units than many larger machines.

56 lb. SCOOTER

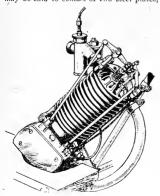

55 × 60 mm, Four-stroke Engine with Overhead Valves and Detachable Head.

I'may be recalled that in our issue for June 5th, 1919, we illustrated and described the scooter built privately by Capt. Smith Clarke, of Kenilworth. The design of this machine has been adopted by Messrs. Booth Bros., of Bishop Street, Coventry, who will enter the scooter market immediately with the Kenilworth scooter.

Most of the features of the Smith Clarke have been retained, the modifications being merely the fitting of a four-stroke engine with mechanically-operated inlet valve in place of the old Clement engine used by Capt. Smith Clarke, and the adoption of smaller wheels.

Frame Construction.

Probably the frame design and construction is the simplest of any type of two-wheeled vehicle. There are very few brazed joints, and these are confined to the head and fronk fork. The frame may be said to consist of two steel plates,

An overhead valve engine is fitted to the Kenilworth scooter.

The Kenilworth scooter on the road.

six detachable tubes, and steering head. The last mentioned is a long tube having a lug at each end, which closely resembles the seat-pillar lug of a lady's pedal cycle. To these are fixed, by boths, the six tubes connecting the head with the two steel plates forming the "chassis." These latter are connected by long bolts having tubular distance pieces.

The fork consists of two long tubes curved at the lower end, carried right-up to the handle-bar and connected to the steering column by a long bolt.

The Transmission.

On the outside of the right side plate of the frame the engine is attached by means of bolts, the flywheel being between the two plates and the magneto on the outside of the left plate. The flywheel carries a V pulley, from which the primary drive is taken to a countershaft by means of a jin. Whittle belt. This countershaft takes the form of a hub which is carried in slots in the plates for the purpose of chain and belt adjustment. From the countershaft tak the drive is by chain to the rear wheel

The engine is a neat little unit having a detachable head to its cast iron cylinder and an aluminium crank case. The push rods operating the overhead valves are

set at an angle, and are actuated by a single half-time wheel having two cams.

18 x 2in, wheels, 4in, mudguards amply valanced, single lever carburetter, Runbaken magneto and two brakes are included in the specification and the machine finished in all black. The price is forty-two guineas.

No brazed joints are used except on the steering column.

The Editor does not hold himself responsible for the opinions of his correspondents. All letters must be addressed to the Editor, "The Motor Cycle," Heriford Street, Coventry, and must be accompanied by the writer's name and address.

SILENCERS-A WARNING.

Sir,—I would like to give a word of warning to the motor cycling public in general through the medium of your

paper (subject to your approval).

While riding a standard machine, as issued from Messrs. Douglas Bros., in March, 1919, untouched in any way, I was stopped while passing through Bromley (Kent) on the grounds of not having an efficient silencer. As a result of which my purse is the lighter by 10s., in spite of the kind help the A.A. and M.U. gave me by defending me.

The week previously my friend, while trying a new machine, was also storned for passing a cuttout being nursuar that

was also stopped for having a cut-out, being unaware that

one was fitted.

Is not the Donglas silencer, consisting of expansion chamber and extension pipe, usually considered efficient?

Motor cyclists would be well advised to skirt Bromley, not only for the above reason, but on account of bad roads in that district.

F. R. G. SPIKINS.

REPAIR OF ROADS.

Sir,-I should like to call attention to the methods of road repair employed in Scotland.

I was recently returning from a trip to Inverness, and, as I was overtaken by darkness, was forced to light my lamps at Killiecrankie. Just before entering Dunkeld, and after coming round a sharp corner. I ran full on a patch of loose road metal about a foot deep, and laid right across broad I think it would have been impossible, even in broad daylight, to have avoided crossing this rough patch, as it stretched from one side of the road to the other. The same thing was experienced just before reaching Perth. I should like to know what our motoring associations are doing to prevent this sort of thing. It is extremely dangerous, and I was very nearly thrown from my machine each time. An older man might have had a bad fall.

Can nothing be done to stop this absolutely dangerous method of road repairing?

Glasgow.

A CRITICISM.

Sir,-When so much is written and so much praise bestowed on the general excellence of the modern motor recycle by its manufacturer, a few words of complaint are not out of place by one of the riding public. I have been an owner of motor cycles and small cars since 1909, and at present own an 8 h.p. motor cycle and sidecar of well-known make, which takes me to and from my duty four times daily. I have no fault to find with the various parts which go to make the modern machine. Engine, theirs magneto carburatter gar how wheels and tyres parts which go to make the modern machine. Engine, chains, magneto, carburetter, gear box, wheels, and tyres, etc., are individually well made and give splendid service. It is in the assembling of all these parts to make the complete machine that the fault lies. The parts have improved, but the design of the complete machine differs very little from that sold to the public ten years ago. When such a large percentage of motor cycles have sidecars attached, surely it is apparent that the transmission must be on the off side of the machine, where it can be accessible. Both the magneto and carburetter should, and can, be so placed that adjustments can be made without the present difficulty. Mudguarding is a disgrace-it is impossible to go out on a modern machine over a wet road without receiving a mud bath from the knees downward. The front brake is a relic of the push-bicycle, and ought to have been

abolished with push-bicycle mudguards years ago. Cables and abolished with push-dicycle mugginitas years ago. Cames ano nuts still stick out from all corners as they did years ago, and the latter are usually inaccessible to a spanner. And so on ad lib! There is a vast public waiting to boy and use, largely for business purposes, a motor cycle as soon as a really modern machine is produced. At present there is not such a thing.

Lulworth.

BEWARE OF MOTOR THIEVES:

Sir,-A few days ago a man called to buy my Douglas, as it had been advertised for sale in The Motor Cycle. He

as it had been advertised for sale in The Motor Cycle. The earnestly requested me to deliver it to a given address at 8.30 p.m., where his father would pay me the cash. Somehow, I could not trust that man, so I consulted my two friends, who had kindly volunteered to deliver my machine in the evening. About fifty yards before my friends reached the address they were greeted by that same man, who told them that his father would presently come back from the club, and, furthermore, he would like to try my machine. He was surprised to see one of my two friends escorting my machine with his Humber, and the fellow kept asking which was the faster machine of the two. My friend kept his eyes on the suspected man, and followed him all the time with his Humber while the trial took place. Eventually the man knew the game was up, and made an excuse that he was going to call his father home to pay us the cash, and then he disappeared.

My friends called at once at the address, but found out by the landlady that there was no such man living there. Even the postman passed by, and told us that he had not known such name in that road. ALMOST A VICTIM.

Sir,—In almost every issue of your paper I see articles or letters extolling the virtues of the simple single-speed machine of the type that was in current practice ten or twelve years ago, and more or less running down the modern three-speeder de luxe.

At the risk of calling down on my head the scorn of the "Old Brigade," may I be permitted to ask why? We are told that variable gears tend to decrease the efficiency of the engine and camouflage its defects, that the modern engine depends on revs. and not pulling power to do its work, and so on. Surely, the main object of a motor cycle is to carry one or more people anywhere, with the minimum trouble and anxiety, and without any unnecessary taptwiddling. I can see no reason why one should be under twidning. I can see no reason why one should be under the necessity of carefully choosing one's route, so as to avoid any hill that may be beyond the power of one's machine, or why one should have to look dubiously at a hill, and pray that one may be able to get to the top with-out shedding the passenger, when the remedy provided by multi-gears is at hand. Can anything do the myement multi-gears is at hand. Can anything do the movement more harm than the sight, common enough in the old days, and which ought to be extinct by now, of a perspiring man pushing his machine up a hill which it cannot take under its own power?

No, by all means, let us have our gears, and take the steepest hill, or go through the thickest traffic, without a qualm, for we are not all experts, but wish to get the most out of our mounts with the minimum of trouble and anxiety.

Wimbledon

REQUIREMENTS OF A BUSINESS MAN.

Sir,—In choosing a passenger motor cycle combination one is faced by difficulties. The man who drives a machine every day of the year on business, whatever the weather may be, wants certain items included, and it seems impossible to obtain these combined in any one machine. I am open to wager none of your readers can name a machine that has all the following essentials, none of which are luxuries, but just the following essentials, near the bare necessities:

(L.) Steering head that will wear 10,000 miles without renewals of balls and constant adjustment.

(2.) Totally enclosed and self-lubricated chains.(3.) Sidecar fixings with the bolts not across the direction of strain and pressure.

(4.)

Three-speed gear.
Inlet valves enclosed.

(6.1

Efficient leg guard and undershield.
Two efficient brakes on independent wheels, one to be fixable by handle and ratchet to hold machine on gradients. Interchangeable wheels.

(9.) Hubs that will wear 10,000 miles without constant

renewals and adjustments.

Re (1.) Present push bicycle steering heads are really dangerous. I have recently seen two machines of different makes (one mine) in a garage together with the steering column cut right through by broken balls falling down from the top bearing. Two narrow escapes of probably fatal accidents.

Re (2.) Properly enclosed chains last wonderful mileages. I did 16,000 miles on my last Matchless rear chain, and the

front was never renewed. Re (3.) Bolts across the strain in sidecar fixings quickly

wear, and the holes wear oval.

Re (5.) Side by side valves means leaky inlet valve stems in a very short time. These are incurable, as valve guides always become seized and cannot be removed. Best induction system I know is the M.A.G., with its enclosed overhead

inlet valve rocker lubricated from the crank case.

Re (7.) Stirrup front brake barred. If makers had to ride heavy sidecars on our Gloucestershire bills in the winter they would soon provide a safe second brake. One wheel locked will often fail to hold a machine. [Wheels should never be locked; better braking effect is obtained with the wheel

revolving. -ED.]

Re (9.) In a number of machines I have yet to find one that has sufficiently robust hubs. I used to think it was lack of lubrication, but since I have had a turnout with a first-class system of hub lubrication by pump injection of grease, which I have strictly attended to, I realise it is the insufficient quality of hubs that is at fault.

Lastly, a real good clutch is, of course, essential. In my experience, the Matchless clutch is indestructible; but I have worn out a cork inset clutch in another make in too

short a mileage to be satisfactory.

I would very cheerfully go minus rear springing, which I regard as very probably a source of unreliability, if I could there are many others similarly situated. It is winter riding that finds out the weak spots.

D. W. GROVER.

SHAFT DRIVE.

Sir,-I have frequently of late seen various criticisms of

shaft drive in your estimable paper,

Having been the possessor of four different makes of motor cycle this year, I should like to add my testimony to the efficiency and desirability of shaft drive. It has been my unfortunate experience to have chains breaking, stretching, and also giving trouble generally.

As regards belts, these have been known to break and occasionally to slip, and certainly require attention more

or less frequently.

Coming to our shaft drive, in the writer's case this machine has travelled thousands of miles, the only attention neces-sary being to fill up the gear box with light grease. There is not the slightest doubt that this machine will continue to go thousands of miles without further attention. I should be very pleased to know how many riders of belt and chain-driven machines can say the same thing. I should further like to add that at no time was there any care taken in the driving of this machine, all sorts of odd gear changes having been carried out occasionally, which further goes to prove its indestructibility.

I have no interest in the F.N. concern other than being a very well satisfied owner of the neatest, cleanest, and the most sweet running no-trouble transmission that has been

brought out up to date. Tynemouth.

FN 1873:

DERELICT AMERICAN ARMY MOTOR CYCLES

It is stated that the American Army shipped 40,000 motor cycles into France. This photograph shows one of the big dumps on the other side of the Channel where wrecked machines are being collected. The work in connection with the salvaging of these motor cycles is performed for the most part by German prisoners

A selection of questions of general interest received from readers and our replies thereto.

All cuestions should be addressed to the Eultor, 'The Motor Cycle,'

20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents
are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters rontaining legal
questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A First Choice.

Being a reader of your valuable paper since No. 98, might I seek your advice? I wish to buy a motor cycle and sidecar. As it is my first machine, I should be glad of a little advice as to the best motor cycle; also what h.p. I see many people advise \$\frac{1}{2}\$ or \$4\$ h.p. Do you think that sufficient?—G.R.

We can thoroughly recommend any of the well-known makes of 3½ h.p. or 4 h.p. motor cycles for all ordinary sidecar work, and would be inclined to advise you to try a big single, as you say that this is your first mount. You will realise that we cannot advise any specific make, but if you make your selection we will gladly advise you if the machine is really sound.

Starting Trouble.

Each time I start my 5½ h.p. Sunheam from cold it will now work regularly, and does not take any air for about half a mile.

After that distance it takes full air and works spendidly—all day, if necessary. Should the engine get cold again the trouble reappears for the half-mile. The carburetter is quite clean, floods well, filter from tank clean, petrol pipe clear, and everything as clean as possible. My magneto, a Splitdoff, has been in use for four years without a hitch, and, to all appearances, is in order. Can this have anything to do with it?—SENSPRAY.

The trouble with your engine is most probably due to the fact that the inlet valve is worn in its guide, thus rendering starting difficult; also notice if there is clearance between the tappets and valves when the engine is cold. Since the engine runs perfectly when warm, it seems unlikely that there is any defect in the magneto.

Partnership in a Patent.

There are two partners of a certain invention which has been patented in their joint names.
(1.) Can one of these partners (1.) Can one of these partners ommence manufacturing without consulting or obtaining the consent of the other, certain friction having arisen between them? (2.) Supposing the invention can be manufactured by one person, can the other partner claim any of the profits; or, should there be a reverse balance, would the other partner be liable for any portion of the deficiency? (5.) In the event of the manufacture of the article, is it not necessary for it to have the patent number and the joint names of the inventors or any other material facts affixed to the article? (4.) Is it possible for the partner to give a sole agency? (5.) Can a partner sell his half share to a third party-R.J.D.

(1, 2, 4, and 5.) You do not refer to any written agreement between the parties, so we presume that there is none. If there is, then this reply is subject to anything which any such agreement may contain. The joint ownership of a patent does not necessarily create a partnership. is a partnership between the parties, then, during its continuance, the patent would belong to them as partners and could only be worked or dealt with by the partners jointly as such. If, however, it is merely a case of co-ownership, then one may use the patent without the consent of the other, and is not bound to account to the other for any profits made, nor is the other party liable for any loss. The power of a co-owner to grant a licence without the consent of the other depends on the words of the patent. It would seem that any profit made by a co-owner by granting a licence must be accounted for. A co-owner could sell his half-share to another party, but a partner could only have the partnership wound up and a sale of the assets in such winding up. (3.) There is no obligation to impress on the article itself either the patent number or the names of the inventors, or any other facts, but one is not entitled to recover any damages in respect of any infringement of a patent unless the article manufactured is impressed with the word "Patent" or some other word implying that a patent has been obtained, together with the year and number of the patent. Otherwise, it would be open to the defendant to show tbat at the date of the infringement he was not aware, or had no reasonable means of making himself aware, of the existence of the patent. You will notice that we use the word "damages" only; but even if the article is not impressed as above mentioned, the patentee can still obtain an injunction against the defendant to prevent further infringement. It will therefore be seen that it is incumbent upon a patentee to see that the patent is properly marked if he wishes to preserve his right to damages.

Benzole.

Can you please tell me if there is any benzole sold yet which does not remove all signs of enamel from one's tank? I got a brand new motor cycle recently, and had the tank filled with benzole, as I had previously used it on my last machine. You can imagine how pleased I was when, getting off for a stretch by the roadside, I noticed the paint peeling off the tank where the benzole had leaked out through the filler cap.—C.E.N.

Our own experience of benzole does not point to the fact that its use seriously damages the enamel of the tank, unless the latter is finished with extremely poor materials. Of course, a certain amount of care should be exercised in filling, and it is better not to fill the tank so full that the benzole is split when the machine is running.

MOTOR CICLE

Handle-bar Shapes,

Will you give me your opinion of the comforts or discomforts of T.T., semi-T.T., and raised touring handle-bars?—P.W.

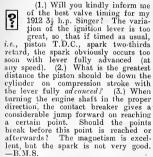

Of the three types of handle-bars you mention we think that you would find the semi-T.T. the most satisfactory for solo riding. Extreme T.T. bars are apt to be uncomfortable, as the whole of the rider's weight is thrown on the wrists, whereas raised touring bars do not give very sensitive control of the steering.

A Magneto Defect.

get a spark now and again. I should be very pleased if you could give me an idea what might be wrong.—J.B.C. Probably the armature spindle bearings of your magneto are worn, thus allowing the armature to come in contact with the magnet pole shoes owing to the tension of the chain pulling it sideways. This will not happen when the magnet is off the machine and you are revolving it by hand. We should advise you to submit it to the makers.

Timing Questions.

(1.) Time your valves as follows: Rotate the engine until the piston reaches the top dead centre, and in this position insert the cam wheels so that the exhanst valve is just about to close and the inlet just commencing to open. (2.) Connect the magneto drive when the piston is \(\frac{3}{2} \) in. from the top of compression stroke, and the contact breaker points are just separating, having the ignition control fully advanced, separation of the contact breaker points should be coincident with the tendency of the armature to jump forward.

READERS' REPLIES.

The Zenith Gradua.

I see in The Motor Cycle for December 4th that "R.S." (Oxford) is wanting a few hints about a 5-6 h.p. Zenith-Gradua-Jap (clutch model). As I have ridden one of these machines for some time, I will venture to air my opinion. (1.) Riding solo, I can do about seventy miles per gallon on No, I. I rode from Burton to Newcastle-on-Tyne (about 168 miles),

and used about two and a quarter gallons, which is pretty good. (2.) My 'bus had a hand start, and I generally had to prime one cylinder before starting up. Personally, if riding solo, I think it is much better to run and jump on. as it saves priming and time. (3.) My bicycle pulls a big coachbuilt Millford sidecar with three adults on with ease; I can get up anywhere with it. A short time ago, without a sidecar, I and a friend (he is 12 stone, myself 10) went up a hill which was I in 5, with a very sharp bend near the top. We got up on all throttle with no air, without changing down on the Gradua gear; but with a mixture I had to wind down one turn to get up. These are points to remember: (a.) Do not run slowly with gear wound up high. (b.) Do not mess about with the gears when the 'bus is stationary. (c.) Use No. 1 petrol and B.B. Vacuum oil. (d.) See that your belt does not get too slack, or your engine will race. I have previously ridden a 7-9 h.p. Indian and also a N.U.T., but, in my opinion, a Zenith is the finest mount on the road. With a J.A.P. engine and Gradua gear you can laugh at the hills.—J.S.W. (Burton).

Blacking Cylinders.

Regarding the question of blacking cylinders, the following instructions may be useful. I have used the preparation for the last eight years with splendid effect and results. Purchase two small packets of carbon black or lampblack, mix this into about half a pint of methylated spirits, and well shake together. Then add about two tablespoonfuls of shellac varnish. The varnish causes the black to adhere firmly to the cylinders, and it will not rub off. Care must be taken not to put too much varnish into the black, otherwise, instead of having a nice dead black, it will be glossy and peel off.—A.E.C.

Several formulæ for blacking cylinders have recently appeared in The Motor Cycle, but I venture to suggest another: About one teaspoonful of any quick drying black enamel—such as is used for "touching up"—with four times the quantity of engine oil, in about half a pint of petrol. The great thing, of course, is really to clean the metal before applying blacking of any sort or make, but this stuff seems to wash down as well as blacken, and when dry does not rub off.—S.A.B.

RECOMMENDED ROUTES.

OAKHAM TO LONDON .- W. E.B.

Oakham, Uppingham, Holkingham, Kettering, Higham Ferrers, Rushden, Bedford, Shefford, Hitchin, Welwyn, Hatfield, Chipping Barnet, Finchley, Highgate, London. Approximately 100 miles.

NEWCASTLE TO PORTSMOUTH, -G.E.H.

Newcastle, Nevilles Cross, Darlington, Northallerton, Boroughbridge, Wetherby, Aberford, Doncaster, Tickhill, Worksop, Mansfield, Nottingham, Long Eaton, Cole Orton, Ibstock, Hinckley, Coventry, Banbury, Deddington, Oxford, Abingdon, Newbury, Whitchurch, Winchester, Bishop's Waltham, Wickham, Fareham, Gosport, by ferry to Portsmouth.

Removal of Premises.

A. H. Hunt, of 115, Cannon Street, London, E.C.4, removed his offices and works to H.A.H. Works, Tunstall Road, Croydon, Surrey, on December 22nd.

C.A.V. Magnetos.

At the recent Motor Cycle Show at Olympia 148 machines were fitted with C.A.V. magnetos, this number being almost one-third of the total number of motor cycles exhibited.

Empire Sidecars.

Lowe's Empire Motor and Sidecar Co., Ltd., inform us that they have moved into new premises in Princip Street, Birmingham, where they have built and equipped new works on quite modern lines.

Enfield Repairs

Having now arranged increased accommodation, the Enfield Cycle Co., Ltd., of Redditch, are again in a position to undertake the repair and renovation of Royal Enfield motor cycles, and to give almost immediate attention to this class of work.

Amac Carburetters.

The makers of the popular Amac motor cycle carburetters, formerly known as the Aston Motor Accessories Co., Ltd., wish us to announce the fact that the style of the firm is now Amac, Ltd., the address being Aston Cross, Birmingham.

A Correction.

In our review of sidecar designs exhibited at Olympia, which appeared in the issue of The Motor Cycle dated December 4th, a slight error crept in when we described the A.J.S. sidecar as having a folding luggage grid. This is not correct, as the luggage platform on this machine is a rigid structure attached to the body and sprung with it.

A New Liverpool Showroom.

Messrs. J. Blake and Co., of Liverpool, Manchester, and Birkenhead, opened their recently acquired showrooms at 110-112, Bold Street, Liverpool, on Saturday, December 18th, the occasion being marked by a press view. In addition to Messrs. Blake's well-known activities in the motor car and body-building world, last year they entered the motor cycle business, and many interesting models are being shown in their new premises.

The A.C.U. Touring Guide.

We have received the official touring guide of the Auto Cycle Union, 1919-20, containing full information concerning the Auto Cycle Union and its working, a list of local consuls, who are of great value to A.C.U. members, a list of hotels and repairers appointed by the Union, also a distance table, enabling the reader to reckon the distance between the principal towns in the United Kingdom.

The BEST RESOLUTION OF ALL

And the easiest to carry out.

During this week of many and varied New Year resolutions the one which stands out as the most practical-and, incidentally, the most advantageous is the good resolve to join the Automobile

Association without further delay.

The procrastinating motor cyclist can find no better way of "turning over a new leaf" than by becoming a member of the A.A., nor can he ob'ain a better return for the modest outlay which membership of the Association entails.

The annual subscriptions, which run for twelve months from date of joining, are for

Cycle Car and Motor Cycle owners 10/6 Light car owners £1 1 0

Motor Car owners £2 2 0

In return the A.A. provides an efficient. complete, and up-tethe-minute Road Service which functions seven days a week throughout the year and is equally accessible to members living at Land's End or Johno'-Groats.

This service includes benefits which could not be obtained by non-members

many times the cost of the subscription, and they are only made possible by the "mass" membership of the Association and its progressive policy of providing better service each succeeding year.

The following are the "Always at your Service" benefits now enjoyed by every member of the

Automobile Association:

Free Service of A.A. Patrols. The patrol service extends over thousands of miles of main road, so that the khaki-clad A.A. patrol is one of the best known figures on British highways.

Free use of Roadside Telephones, which are installed in patrols' sentry boxes all over the country. This service has been extended so that it is available

both day and night.

Free Assistance by "Mechanical" First-Aid Motor Cycles. These outfits (driven by A.A. khaki-clad mechanics) carry a complete equipment, enabling light repairs to be done "on the road," so that a member can continue his journey after a breakdown and avoid being towed home.

Free Legal Defence in any police court in the United Kingdom to answer charges under the Motor

Car Act.

Free Legal Advice on any matter connected with

Free Touring Information, including routes showing the best roads to any part of the United Kingdom.

Free Touring Assistance to members going abroad

with car or cycle, including the privilege of taking a motor cycle into a 70% tariff country on a banker's indemnity alone, and without depositing hundreds of pounds in respect of customs dues.

Other privileges include Engineering Assistance. Special Insurance Facilities, Officially Appointed Agents and Repairers, A.A. Hotels,

Full particulars of all benefits are contained in the booklet, "The Key to the Open Road," a copy of which can be obtained, post free, from the Secretary. The Automobile Association, 21, Fanum House, Whitcomb Street, London, W.C.2. Send a postcard to day.

Motor cyclists in London are invited to call at Headquarters, where a staff of experts is always in attendance to give information on any question relating to Motors and Motoring.

REPORT ON NATIONAL BENZOLE ROAD TEST.

This report has now been completed, and can be obtained by members from the Fuel Department. It is published in two editions: paper covers at 3/6 post free, and cloth binding, making it a permanent book of reference, at 5/- post free.

MISCELLANEOUS ADVERTISEMENTS.

ADVERTISEMENTS in these columns First 12 words 2/6, and 2d. for every additional word. Paragraphs of under 8 words are charged double rate. i.e., 5/-. Each are charged double rate, i.e., 5/-. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and he addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19. Heriford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should 1216 quote the number which is printed at the end of 1220 each advertisement, and the date of the issue 1219 in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken 1227 to avoid mistakes.

to avoid mistakes.

NUMBERED ADDRESSES.

For the coovenlence of advertisers, letters may be addressed to oumbers at "The Motor Cycle" Office. Total the control of the advertisers on registration and to cover postage on replies must be added 11762 to the advertisement loange, which must include 112356 to the advertisement loange, which must include 112356 to the advertisement loange, which must include 112356 to the advertisement. All replies should be control of the advertisement. All replies should be called advertisement. All replies should be control of the district ments containing remittances should be sent by registeria post, but in all used cases it is advisable to make use of the Deposit System. [12276] to the advertisement and the control of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who besitate to seed money to unknown persons may deal to perfect safety by availing themselves of our persons with the perfect safety by availing themselves of our persons who have the perfect safety by availing themselves of our persons with the perfect safety by availing themselves of our persons with the perfect safety by availing themselves of the persons with the

SPECIAL NOTE.

Readers who reply to advertisaments and receive no answer to their enquires are requested to recard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

A.B.C.—Deliveries commencing after the Show. Have you ordered?—Prompt deliveries from Victor Hovman, Ltd., 7, Mount Pleasant, Lverpool. [0021]
A.B.C.—Book early and prevent disappointment Specification and full patteclus; will be sent on application.—The Spaiding Metor Cu., Ltd. Spaiding distributing agents for Lincolnshire.

ON the first day of the New Year—the day for New Resolutions-we look back to the early days of Godfreys in 1910, and recall the first resolution of the firm: that, succeed or fail, we would run the business on straightforward lines.

In 1911 the late O. C. Godfrey won the Senior Tourist Trophy Race on an Indian.

In 1912 Mr. F. A. Applebee, emulating the example of his partner, won the Senior Tourist Trophy Race on a Scott.

It was a good start for a young firm, as it gave the public confidence-it was evidence that the business was run by men who knew something about motor cycles.

Since those early days we have had no cause to complain of lack of encouragement, and we have done our utmost to deserve the goodwill of motor cyclists throughout the Kingdom.

It is our resolution on this, the first day of 1920, to continue on exactly the same lines. To give complete satisfaction to every customer irrespective of the amount of his purchase, and afterwards by service and attention, to secure his friendship and recommendation.

It is thus that-

Our sales increase our friends,

Our friends increase our sales. We are at all times pleased to show prospective customers our representative stock of new machines, and having placed large contracts can, in the majority of cases, give early deliveries.

1920 Competitions.

O it better" is a commendable motto for all to adopt at the commencement of a year. Especially is this true for 1920, as practically everything is in the melting pot, and in every sphere our aim should be to emerge with decided improvements upon old methods and standards.

The A.C.U. opens the year, first, by arranging and announcing a list of competitions for the coming year, and, secondly, by limiting the number of open competitions. In the former case, clashing of dates—a deplorable feature of last year's trials and competitions-will be avoided to some extent. In limiting the number of open events to twenty, a set programme is arranged from which manufacturers may select those best suited for their purposes of exploitation, and can make arrangements accordingly. The limiting of events will have another good effect. It will set a higher value on awards, and the remaining trials will, in all probability, be better run. In several cases, clubs in certan localities will join forces for the purpose of organising their trials; in consequence, a larger number of experienced officials will be available, and, since the importance of such events will be enhanced on the score of numbers and standing, they will take their duties more seriously.

Twenty Open Events.

At first sight, the limit of twenty open events does not appear to restrict the number over previous years-over 1919, at all events-but with new clubs and revived clubs coming into existence as a result of the ever increasing numbers of motor cyclists, the number of open events probably would have been greatly in excess of this had not the A.C.U. intervened. Such a contingency was not to be desired for many Too many trials reduce the value of each individual event, both as a test for gauging reliability and as propaganda for the motor cycle movement. Probably the support of the trade entrants would become less and less on this account.

On another page will be found a complete list of 1920 competitions—a formidable list, when the many closed but classic events are taken into consideration. It may be considered that the list is still too long. To participate that the list is still too long. in all, a manufacturer will have to maintain a special staff, which will be busily engaged throughout the year. Very few makers, however, will be interested in all, as many take notice only of trials, while others give preference to speed tests. In the list are included a number of Continental events, which. again, only interest the minority. taking the year's programme as a whole, it may be said that it is one likely to give satisfaction.

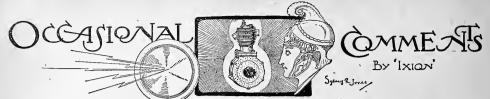

The Scottish Trials.

It will be noted that the Scottish Six Davs Trial is not mentioned, and, as this is not one of the twenty open events generally supported by the "trade." -one is constrained to wonder whether there is not a danger of some misunderstanding, such as existed last year. will be remembered that this muddle was no fault of the A.C.U., which body has no jurisdiction where the Scottish Trial is concerned, but rather that of the Manufacturers' Union, whose decision on the question of whether the trade should support the event was delayed. It should be pointed out that the twenty open events referred to are those allotted to clubs by the A.C.U.

As will be seen from the diary of forthcoming events, there is to be a revival of track racing, both the Brooklands Club and the British Motor Cycle Racing Club having several dates.

The first two events of the year will be the Colmore Cup Trial and the Paris-Nice event, both of which are to be held next month. It is to be hoped that both trade and public will support the programme, and that 1920 will prove a milestone in the matter of organisation.

Two Trips.

HAVE just dined at a friend's house. Dined very well, too. Neither are his cigars bad. But there is a fly in the ointment. In an hour or two I shall have to ride home. The month is Decem-The roads are ankle-deep in half-frozen slush. A nor'-easter is raging across the heath, with an edge on it like that described in safety razor advertisements. At intervals a mixture of hail, rain, sleet, and snow is falling. No sane man pretends that a motor bicycle is an ideal vehicle for such weathers. My, host will doubtless press me to stay the night. How I wish I could; but an early engagement to-morrow forbids. I shall throw a chest, and pretend that I enjoy such North Sea weather. Probably he will hear my teeth chattering as I go down the drive. Two miles away I shall probably puncture, in which case I shall certainly sit down and cry. My fate is all the harder because when I take my bicycle out of its garage, I shall catch sight of the snug little coupé which my host affects.

To-morrow evening a worse ordeal probably awaits me, for I must tackle a sixty-mile run, out and home. under conditions which will almost certainly be similar.

The moral of these reflections is that the monocar is worth far more attention than it has ever received. Quite a lot of monocars have appeared on the market at various periods. Some of them were original and promising. Soon after their debut various admirers suggested additions to the specification. Quite half the enquisies had reference to a second seat. Gradually the cost towered, and the equipment grew, until com-petition with the simple motor bicycle absolutely evaporated. I wonder what would happen if a firm brought out a first-class monocar of the simplest type, and absolutely refused to clutter up his specification with additions.

The G.W. Buckboard.

IKE its famous ancestor (the Orient), the G.W. Buckboard takes no stock of weather protection, It aims at providing the cheapest imaginable side-by-side transport for two persons, and it is, therefore, irrelevant to my present topic. I do not believe that all-weather riders are afraid of sideslip; and, if they were, a four-wheeled sideslip is much less controllable than a two-wheeled sideslip, though the latter is more easily provoked. I fancy that protection from cold and wet is the secret of the widespread hankering after a good monocar. Men's thoughts turn to three and four wheels in winter, because they despair of satisfactory weather protection on a two-wheeled chassis. I would not say that this despair is justified. Makers are at last giving us what a car designer would call an underscreen; and a somewhat timid and incomplete type of leg-shield is dawning as a standard

in several specifications. By degrees we may get protection as high as our waists; and then the accessory merchant may step into the breach with a detachable V fronted windscreen for mounting on the handlebars. Such a 'bus would fill the bill as well as any historic monocar, and might prove more comfortable, besides being cheaper. It might inveigle timid and elderly persons of small means into taking up winter riding, and the sideslip problem would then grow more acute, leading to an increased interest in three and four-wheeled machines with skidproof tyres. Lest I seem to be looking too far ahead, let us remember that the G.W. Buckboard may yet be fitted with an all-weather single-seater body; and in that case we should have realised a monocar, of the indicated type, selling at less than £100. I do not mean to imply that the real monocar market may not centre round something more sporting than a 31/2 h.p. four-wheeler, for the all-weather rider is usually a bit of a sportsman, and lets his machine rip when the elements permit. Still, even 3½ h.p. is capable of all the speed most men want in mid-winter, provided it is not slowed down by excessive weight and wind resistance.

Utility Motor Cycles.

O survey another fact of the same question, many authorities lay great stress on the utilitarian aspects of the motor cycle. The man who uses a motor cycle for business purposes is necessarily in a small way of business, otherwise he would use a car. A man in a small way of business can seldom afford to maintain separate forms of transport for the various seasons. If a motor bicycle is useless in winter, a motor bicycle is of limited business value. Broadly speaking, it is true that a motor bicycle is commercially useless. There are exceptions. I know men who do their journeys by motor bicycle when the weather is good, and by train when the weather is bad. I know men who use a car in bad weather, and save a few pounds annually by riding a motor bicycle on fine days. But, broadly speaking, the commercial utilityof the motor cycle is limited to the three-wheeled editions; and the grievous discomfort of a two-wheeler in really bad weather is the prime cause. Now there is a chasm between the respective economies of the motor bicycle, on the one hand, and the sidecar or three-wheeled runabout on the other; the two latter. are perhaps three times as expensive to run as a twowheeler. The economy of the two-wheeler as a business vehicle admits of tremendous exploitation if it can be adapted for use on 313 days in every year, i.e., if it can be made cosy for runs of moderate length in midwinter. If this task defies solution, the light, simple monocar is an alternative of perhaps greater promise and almost equal economy.

Occasional Comments .--

Actual Examples.

SPENT part of my holiday last year in a remote village devoid of all ordinary transport. Few denizens from the bigger world were ever seen there; the only regular links with civilisation were the doctor, the nurse, the postman, and an individual who was in the egg-and-chicken line, or something of that sort. The doctor used a car in bad weather and a Triumph two-stroke when the skies permitted. The district nurse used a ladies' model Douglas, but the managing committee lay awake at nights wondering what they would do if she got married; for they had the sense to realise that only an exceptionally plucky girl would stand such a racket through the winter; and if her successor refused to ride a motor bicycle, the alternative would be two nurses or half service. The postman carried such a heavy load that no motor bicycle could do his work; he used a horse and trap, which was regarded by the authorities as cheaper than a sidecar; but walked some six miles daily as well. The consequence of this mediæval transport was that letters arrived towards noon, and post went out at 3.30 p.m. The poultry-gentleman employed a motor bicycle in summer and a trap in winter. Of this quartette, the doctor, the nurse, and the "regrater" (as the poultry travellers are locally called) are all obviously candidates for the cheap and simple monocar, all unconscious critics of the motor bicycle as a utility mount. The postman's case is less definite. I fancy a good medium-powered sidecar would do his work more efficiently than a horse and a trap, including economy as part of efficiency. It is not certain that any monocar could interest him. This glimpse into rural life is interesting, since it shows a tiny population of 300 or so, in which three of the four people who daily travel distances too great for walking stand in urgent need of a monocar.

The Sequel.

KNOW several parts of rufal England with a fair degree of intimacy, and I have seen many such communities as I describe here pass through a regular series of phases in the petty transport which links them up to the rail and to the towns. A few years ago the ubiquitous horse and trap performed this service, and a fifteen-mile journey occupied some three hours, exclusive of stops (trap not very light, horse not very spry, roads not very flat). Presently, some youngster engaged in one form of transport or another bought a motor bieyele. In those early days it was seldom too reliable. It did not accommodate much of a load. In winter he hated it. But he noticed that he could do his fifteen miles in threequarters of an hour. His next step was almost invariably the purchase of a sidecar. This increased the maximum load, doubled the running costs, and left discomfort as you were, or more so. A long hesitation ensued. Motor transport possessed such obvious advantages. On the other hand, the motor bicycle was not poo, and the sidecar rather ditto. Finally, it dawned on him that, though a Ford would cost a lot, it would enable him to extend his business, and would be equally suitable in all weathers. So a Ford it was, if a load of half a ton had to be transported. But neither the doctor, nor the district nurse, nor the canvasser, nor the postman, nor the tallyman, nor a host of other inveterate travellers carry any load beyond a smallish handbag. For them the ideal all-the-yearround transport has yet to be produced. Will it appear as a monocar or as a motor bicycle with full weather protection? Probably the former on account of it standing on four wheels, and not being so liable to fall over and sustain damage in the hands of careless users. Where an individual or firm invests in a machine for the use of a servant, the monocar has certain advantages, as the single seat precludes joy riding.

A 16 h p. Flat Twin weighing $48\frac{1}{2}$ lb.

A French Harizontally-opposed Aero Engine, with Steel Cylinders and Overhead Valves.

THE Paris Aero Show contained several examples of small lightweight air-cooled engines of interest to the motor cyclist and the cycle car

owner. One of the most pleasing of these was the new Clerget horizontally-opposed twin. This engine has cylinders of 85 and 100 mm. bore and stroke respectively; it develops 16 h.p., and measures 28½ lb., and measures 28½ in. from tip to tip, and ir 1½ in height.

This is purely an aviation engine, built with lightness

and reliability in view, and with less consideration to cost than in the case of the ordinary motor cycle

engine. There is no doubt, however, that an engine such as this would be a most desirable power producer on a high-class cycle car. The cylinders are forged,

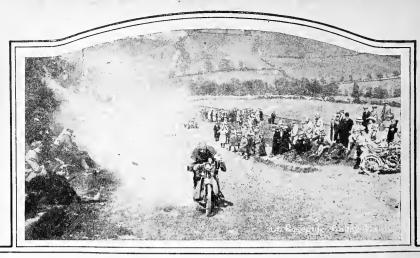

and are machined with their radiating fins; the two valves are mounted in the head, and are operated by push rods and overhead. rockers, and the pistons are of aluminium alloy. The crank case is an aluminium casting in two parts divided vertically, while the oil sump is an aluminium Î stamping. The crankshaft,

which naturally has

The 16 h.p. Clerget flat-twin engine.

two throws, is carried in roller hearings, and the big ends also have rollers. Lubrication is under pressure.

THE 1920 SIX DAYS TRIAL.

By FRED KEIR, Chairman of Newcas le and Dist. M.C.

Suggested Centres and Testing Grounds for this Year's Trial to be held in the North of England.

As announced in last week's issue of

"The Motor Cycle," the A.C.U. has

accepted the North-Eastern Automobile

Association's invitation to hold the 1920

Six Days in the North of England, and

therefore this article, by a prominent

Northern motor cyclist who is closely in

touch with the motor cycle movement in that

locality, cannot fail to interest. Mr. Keir

conveys a good impression of the topo-

graphical features of the North Country,

where undoubtedly there is material for a Six

Days course which will be as severe as any

part of the country where the classic trials

have hitherto been held.

AST year the North-Eastern Automobile Association extended an invitation to the Auto-Cycle Union to hold the 1920 Six Days Trial in the North, and the invitation has now been accepted. The Trial will probably take place next August, and the writer has been commissioned by the Editor to indicate the probable lines which will be adopted in

planning the trial, and to give some indication of the ground which may have to be covered by

the competitors.

There is a wide field for exploration, but at the outset we may profitably remember (r) that the A.C.U. Competitions Committee will probably rule out of court all routes of the sheep-track order, where the failure of any sidecar would baulk following competitors, and (2) that the overall length of each day's work must necessarily be limited to something under 200 miles, since such a mileage means a ten-hour day at legal limit, even when meal-

time stoppages are not taken into account.

Where should headquarters be arranged? Three towns were suggested—Hexham, Darlington, and Newcastle, and each has its advantages. Hexham would bring an interesting section of the Lake District into focus, and would also provide splendid ground of "lonely grandeur" description, in the direction of Slaley and Blanchland—a timbered village ten miles from a railway station.

Darlington would give a fine range of alternative routes, since the Cleveland Hills, and the sea-coast almost to Scarborough, would be within range, to say nothing of the manifold hills which abound in the County of Durham.

Newcastle—the choice of the Motor Cycle Board of the N.E.A.A. and finally of the A.C.U.—scores

heavily, because the city is so well provided with hotel accommodation that the nocturnal comfort of man and steed may be said to be assured. It is true that, at the moment of writing, Newcastle hotels are in line with other hotels all over the country in that bathrooms and dining halls are being utilised as bed chambers by needy travellers; but, six months hence, the pressure may have been relieved. The city, however, is less favourably placed than the other towns mentioned in the matter of difficult country; but is there, in the whole of the British

Isles, any stretch of public highway, of any considerable length, at which the modern motor

cycle would boggle?

Some time ago, when Mr. Hugh Mason put me astride a modern N.U.T., and said, "Now tackle some of the hills in Durham or Yorkshire, and let me know how the machine behaves," I went out like an up-to-date Christopher Columbus on a voyage of discovery, but had to return with a disappointing report. Ragpathside, Ferryhill, and even Sutton Bank, had been

The 1 20 Six Days Trial .-

so flattened out by an efficient engine that they seemed as level as a billiard table.

Probably every motor cyclist has his pet area. If I were to ask Mr. Fred Turvey, of Sunderland, where, in his view, the A.C.U. should put in its Six Days, it is almost certain he would immediately suggest the Cleveland Hills, for it is one of his hobbies to search out fine "stunting" ground in this area. Mr. Fortime, of Harrogate, on the other hand, would probably point out the virtues of the Pateley Bridge district, with its wide range of hills and its long and dreary drag up Greenhow Hill. Mr. Bowness, of Windermere (now of Newcastle), would be equally enthusiastic about the Lake District, and would talk about Towtop with its bends, its two miles of loose surface, and its gradients here and there of about 1 in 3. He would enlarge upon Hardknott and Wrynose between Langdale and Eskdale, about the Blea Tarn Pass out of Langdale, about Kirkstone, Honister and Buttermere Hause, of a stiff hill named Red Bank, near Grasmere, and altogether he would revel in fine praise of his native heath.

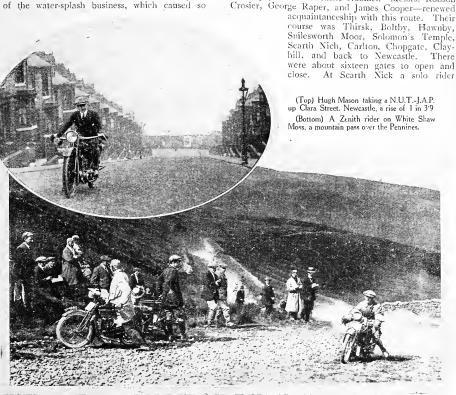

In parenthesis, may I express the hope that, if the Lake District be included, there will not be a repetition of the water-splash business, which caused so much ill-feeling when the A.C.U. visited this area in 1913. Acting on instructions, the mountaineer clubs dammed up the rivulets just before the Six Days Trial, with the result that competitors who knew the course in its normal state were compelled to splash through artificial lakes 2ft. deep, with disastrous effect upon their then vulnerable magnetos.

A Suggested Location.

Mr. James Cooper, Newcastle's competition secretary, rather ambiguously declared that Darlington was 'a good town to get away from,' whilst it had good hotel accommodation and any amount of room for machines in a one-time skating rink now converted into a garage. He suggested that, had Darlington been selected, it would have made possible (1) a day in the Lake District, (2) two days in the Pennine Range, and (3) two days among the Cleveland hills.

Of course, he has vivid recollections of the Bradford Trial in 1914. This trial was the outcome of a speech by the then president of the Bradford Club, in which a general challenge was issued to other clubs too pit themselves against Bradford. Four clubs took up the challenge, and Harrogate carried off the honours.

In 1917 three Newcastle clubmen—Messrs. Robson

The 1920 Six Days Trial .-

in front suddenly disappeared from view. There is a sudden dip, "almost like going down some steps," and at the foot of the precipice is a water-splash deep and wide. At another part is a hairpin, with the bend in the water, so that the continuation of the road can only be discerned when the machine is actually in the water. Altogether, this route abounds in surprises and the necessity for quick decisions.

There are some fine coast routes down to Scarborough, but Newcastle as the centre will rule these out as being too far away. Take, for instance, the road to Whitby, Sleights, up Blue Bank to Pickering, Helmsley, down Wass Bank into Coxwold, and up

Sutton Bank to Helmsley.

Or Saltburn to Whitby and over the moors to Scarborough, returning via Malton and Coxwold to Helmsley and home via Thirsk.

Some Objections to Newcastle.

As for headquarters, my own view is that, although we have some little "stunts" close at hand, so far as Newcastle is concerned, it will mean a twenty or thirty miles flat journey out each day before suitable ground is encountered, and either Hexham or Darlington would provide a better jumping-off stage.

Of course, we have the famous Clara Street in Newcastle: a stretch of 1,000 yards of 1 in 3.9, with a right-angle start from Scotswood Road, and no chance of a running jump. We have the ancient and horribly narrow Bottle Bank at Gateshead, but I doubt whether the police would permit this crowded bit to be included. We have Ragpathside a few miles out, in Durham County: at one time a famous test hill for motor cycles, but now an extinct volcano to a modern machine; and, further afield, we have the Rothbury Hills and the Cheviots; we have Alston, and a terrible "valley of dry bones," near Brough.

I once tried to cut out Brough on a ride from

I once tried to cut out Brough on a ride from Kirkby Stephen to Barnard Castle on a single-geared machine, but the miles I saved cost me about one hour per mile, and a tremendous outlay on "1.p.a." before

I got clear.

A Novel Suggestion for Observation.

Needless to state, the clubs in the North-east are on the alert, and a visit from the A.C.U. will certainly stimulate public interest. May I make a suggestion here calculated to enable good observation to be taken, even on the level ground, which Newcastle as a centre will provide. Why not pair the solo machines for observation purposes, sending out as partners the representatives of different makes, with instructions to report the various causes and duration of his partner's stoppages and general behaviour of the machine?

With sidecar outfits, pool the passengers, and give each passenger a form on which to report fully as above. Thus the competitors would be also given a semi-official standing, and I have enough faith in the honour of motor cyclists to think that they would provide faithful accounts of the proceedings.

I am well aware that to make use of the sidecar passengers in this way is not new, and, if I remember rightly, it caused some unpleasantness in the last trial in which it was introduced, *i.e.*, the Oxford to York

-Twenty-four Hours Trial of 1914.

The Motor Cycle Board of the N.E.A.A. has offered to provide Mr. Loughborough with a dozen alternative routes, out of which he may select five for the five days of actual riding. Those routes have not yet been drafted out, but at my request, Mr. Raper, of Newcastle, has drafted for this article-three possible routes which may be of interest, as he is our best known competition rider. Mr. Raper is one of the sub-committee appointed by the N.E.A.A.—and which also includes Messrs. Q. A. Nicol, O.B.E., and Walton—to prepare a preliminary selection of routes with Newcastle as the centre.

Day Run Route No. 1.

Newcastle to Chollerford (21 miles), a steep bank via Sewing Shields to Haydon Bridge (31), to Greenhead (43), turn right up Glenwelt Bank to Chollerford (60), up Brunton Bank to Stagshaw (6434), turn right to Corbridge and on to Hexham for lunch—a total

of 73 miles.

After lunch, via riverside to Chollerford, right angle up Brunton Bank, with no chance of a running start, to Stagshaw (10), turn left and along hilly Watling Street (the oldest road in the country, first constructed by the Roman invaders) to Elisham Bridge (29), via Otterburn to Elsdon (34), a sharp rise and long climb, very hilly, then down Billsmoor to Rothbury (45 34), up Lakeside Hill and Corby Hill to Alnwick (57 ½), and back to Newcastle for the night (91 ½). The grand total mileage for the day is 164½ miles.

Day Run Route No. 2.

Newcastle via Two Ball Lonnen or Clara Street' down Denton Burn, left to Scotswood Suspension Bridge, up Whickham Hill to Annfield Plain, via Lanchester and Satley Hill to Wolsingham (23¼), via Killhope te Alston (49½), back on the Hexham road to Whitfield (58½), turn sharp up steep hill, continue via Thornley Gate Hill to Allendale (63), and on to Hexham for lunch—a total of 73 miles.

After lunch via Slaley to Blanchland (12), down

After lunch via Slaley to Blanchland (12), down Crawley Hill to Middleton-in-Teesdale (26), Westgate (41), main road to Wolsingham (52 $\frac{1}{2}$ /2), via Ragpathside to Lanchester (64 $\frac{1}{2}$ /2), and Newcastle (76 $\frac{1}{2}$ /2). A total for the day of approximately 149 miles.

Day Run Route No. 3.

Newcastle via Durham to Stockton (34), Stokesley (44), Carlton (48) via Carlton Hill (climbs and water gulleys) to Chopgate (53), over Newgate Hill to Helmsley (65), down Wass Bank, up White Horse Hill to top of Sutton Bank, down Sutton Bank to Thirsk for lunch—a total of 81 miles.

Thirsk to Boltby, up Boltby Bank to Hawnby (10), via farmyards and many gates and water-splashes to Solomon's Temple (22). "down some steps" to Stokesley (36). via Sunderland to Newcastle, a total of 80 miles; making 161 miles for the day.

Mr. James Cooper, of Newcastle, is responsible for

the following suggested route:

Newcastle to Darlington (33½), Scotch Corner (42), Leeming Bar (53), Baldesley Gate, Ripon (56½), Pateley Bridge (79½), Grassington (90½), Aysgarth (109½), Richmond (128), via Darlington to Newcastle—a total of 177 miles. This route includes some severe climbs, as the ascents of Greenhow (from Pateley) and Cray (at Buckden) and the precipitous descent of Kidstones Pass to Aysgarth.

A Well-designed Lighting Dynamo

The Miller 6 v. Generator intended for Small Cars and Sidecar Outfis. It has a Novel Method of regulating Output.

O NE of the most practical and wellfinished small lighting sets we have yet been privileged to inspect is that manufactured by H. Miller and Co., Ltd., the well-known lamp manu-

On, thus, the well-known family manufacturers, of Birmingham.

Owing to careful design and high finish the dynamo size and weight has been cut down until it scales barely 10 lb., mid as the output is practically freed from large fluctuations at all normal speeds by a self-contained magnetic arrangement, no external or bulky mechanical or electrical regulators are required.

Very Small Battery Required.

Another great feature of the device is its cool running, which is again largely due to the use of the magnetic control incorporated, while, furthermore, the voltage being to all intents the same throughout the normal speed range, and a useful output for charging being obtained at very moderate engine revolutions, only an exceedingly small battery is needed; the size actually used being of 6 volts 12½ amp, hour capacity.

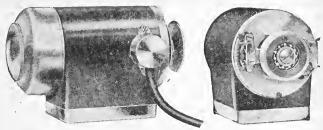

Describing, first, the mechanical arrangement of the generator; it is of normal shunt wound type, devoid of any complications in the way of extra brushes, resistances, or external regulating devices. The overall dimensions are quite small, the size of the machine being about 6in. in extreme length, and 4in. in height and breadth.

Magnetic Control.

In running at ordinary speeds the generator acts in the same manner as other dynamos of its type, but on reaching a pre-determined output the magnetic control comes into operation. and the amperage of the current is reduced. The control arrangement is not only unique, but is decidedly simple. The magnet is of the circular form associated with dynamos of this type, but the base of the casting has an annular groove, in which is located a second shunt coil in series with those which surround the poles between which the armature runs. Laid in the aluminium bottom plate of the dynamo is the regulator plate—a loose piece, of iron held away from the base of the magnet by a short and stiff compression spring.

A typical output curve. The effect of the regulator is clearly indicated at a speed between 1,600 and 1,700 r.p m.

Two views of the Miller electric generator—one showing the complete machine and the other showing the end cover removed, exposing the commutator and brush gear.

When the speed increases unduly the flow of current through the shant coils increases to such a degree that the increased power exerted by the magnet overcomes the resistance of the spring, and the plate is drawn into close contact with it. Another magnetic circuit is thus formed, and, in addition to the main flow of lines of force through the armature, a second flow passes through the regulator plate. Since two narrow parts of the magnet casting are common to

The out ble wiring lead from the dynamo, which obviates bendang the cable.

Triggers controlled by balanced springs provide a direct pressure on the commutator brushes.

both circuits, crowding of the lines of force occurs at these points, with the result that the intensity of the magnetic flux passing round the main circuit and through the armature is considerably reduced. Electrical output, of conrse, is dependent upon the number of lines cut by the armature coils, and, in consequence, the value falls the moment the subsidiary magnetic circuit is initiated.

The effect of the action of the controlling device is immediately seen on the ammeter, when the dynamo is gradually speeded up, and is clearly shown on the accompanying curve. Mechanically, the

Mechanically, the Miller generator is beautifully made, and the brush gear is both simple and substantial. It was particularly noticeable that commutation to all intents and purposes

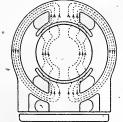

was sparkless, even at speeds corresponding to 60 m.p.h. on a machine with average gear ratios. The brushes, of which there are two, are held up to the commutator by spring triggers, which are balanced in such a way as to provide a direct axial thrust. Ball bearings of ample size are provided for the armature spindle, which is driven by belt or chain at one-and-a-half times engine speed.

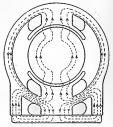

Detail Finish.

Several little detail refinements are noticed throughout the set. Thus, the lamp connections are secured in such a way that there is no strain on the terminals of the cables, which are clamped rigidly m place. A similar construction characterises the wiring lead from the dynamo itself, the cable being firmly clamped in a fibre block covered by a plated cap. It is then secured in a circumferentially slotted circular housing, in which it can be swivelled to any angle, so that no matter what the position of the dynamo, the cable may always be led away in the required direction without loose or untidy bends.

A Smaller Solo Set.

In its present state the lighting set is more suited to runabouts, small cars, and luxurious passenger outfits, but a still neater generator and fittings is being got out which will be specially suitable for solo motor cycles. The whole production scheme is not yet evolved, and meanwhile a large and up-to-date factory is being erected for the manufacture of all Miller electrical equipment.

Diagrams showing the shape of the magnet in the Miller dynamo. The magnetic flux is shown with and without the regulator plate in action.

Pleafor

Left and right show the largest twins used on British machines—the Elackburne (998 c.c.) and Rudge (998 c.c.) (Centre) The Reading Standard (1,170 c.c.), the biggest tw'n-cylinder motor cycle engine.

The Question of Efficiency and Attention

TF we look round the motor cycle manufacturers' drawing-offices to-day, shall we find a tendency creeping in to push up engine size and to lighten things considerably all round? The whole question of what types will become favoured rests to a great extent on the degree of familiarity with which riders have become accustomed to

regard various motor cycles during the long years of war, both at home and on the battlefield.

Before the war, competitions, trials, and races made us very familiar with the 3½ h.p. machine for solo work, and the larger twin for sidecars, with the result that the average man had a fast 31/2 h.p. for his solo riding, and the sidecarist was content with a 'bus

of 6 h.p. or 8 h.p.

War conditions have made it apparent that power is a very desirable feature; but power and reliability are absolutely necessary. The war-time 'bus has been so sifted and "screened" that power and reliability go together. Our engines have gone up in power: the 3½ h.p. "Trusty" has become 4 h.p., the 4 h.p. "Dugger" has become a finished and accepted fact, and the big V twin has been doing war service with great success, in spite of some adverse opinion on the subject. And last, but not least, the 1,000 c.c. limit; which had become self-imposed upon the motor cycle trade, is being regarded with suspicion. American designers have produced some very good machines with engines exceeding the 1,000 c.c. limit, both in twins and "fours," and riders of these give them a character which makes one think. How would you like to ride 13,000 miles without decarbonising? And how would you like to do this distance on an average. petrol consumption of 65 m.p.g. and an oil consumption of 750 m.p.g.? This has been done on a big American twin by the writer, who used the machine for war work in this country; and the engine has plenty of power in it yet, in spite of hard work and many months' neglect.

The Tune of Newness.

As a rule, an engine loses that velvety feel of tune and newness within the first six months of its workaday life, but this varies, of course, with different machines: I say "machices," because horse-power, gear ratio,

Do Small Engines Require Greater Care?

weight, engine control, and driving make a big difference to the life of an engine. Thus one 6 h.p. twin will run for a remarkable time before its engine and transmission begin to give little signs of the inevitable, while another machine of similar size and weight will pull all its velvet off in a very short time, simply

because its designer has not gone into the finer side of the general layout, such as a properly designed cush drive; gear ratios tried out to determine the engine's needs with regard to its revolutions and pulling powers; and, if it be a component engine, such as Messrs. J. A. Prestwich make, it brings something else to bear on the subject: for example, there are two 8 h.p. J.A.P. engines, one "square" engine and one having a short stroke, the former very suitable for long service as a heavy passenger pusher, and the latter more suitable for the road-burning person who crackles along the stretch of macadam just before he reaches the "Hut" at umpty miles an hour. Many a complaint of undue engine wear has been caused by manufacturers carelessly putting light and high-compression engines into heavy passenger outfits, andexpecting them to run satisfactorily in the hands of the public. Of course, they do so in expert hands.

Larger and Lighter Engines.

The idea in causing my readers so much brain fag on the subject of engine shell shock is to put forward my plea for larger and more lightly built engines for hard work. In the newest type of London 'bus the engine power has been increased and the whole unit lightened in order to make a faster running affair altogether; and the tyres—but my readers can sample them on the London streets. The new engine is a large one, 35 h.p., but it serves to show that for work and endurance the designers of these hard-working vehicles find themselves in need of an engine which is on top of its job. The fact of the matter is that our prewar motoring fraternity consisted to a great extent of men who understood the mechanical side of the pastime and, like all people who specialise, they wanted to get big power out of a small plant.

. The result was that manufacturers did not embark on the line of larger engines which obtains in America,

A Plea for Larger Engines .--

and we have small power units which, although they are unrivalled throughout the whole world for mechanical efficiency in power output, are, I venture to say, too small for real hard work and twelve months' neglect. As I have to work very hard for my living I may perhaps be forgiven for neglecting my machine for a year or so.

Scanty Attention.

I have only decarbonised once in two years, and when I took the valve caps out recently there was no carbon to speak of on the pistons and cylinder heads; now I do not think that a 6 h.p. twin would do the mileage (13,000 miles per annum) without needing much more frequent cleaning. In addition to this, the engine has never had any replacements in the way of bearings, piston rings, or valves, and the compression is still good, and no undue wear on the bearings is apparent, "all of widge," as Mrs. Gamp might have said, shows that a big engine is not by any means a dud proposition.

You may argue that this country is flat, and big power is not vital to a successful machine, but you cannot get away from the fact that when an engine is well over its job it is like a locomotive "running light "-it runs all the while, and would give great results to the man who wants comfort, speed, and absolute reliability; together with the greatest asset of all—satisfactory service. To test the reason of these words, use the advice of a well-known manufacturer: "Ask the man who owns one." JAY GEE.

PROTECTION FROM MUD AND RAIN.

A Light Coupe Sidecar Body on a Folding Chassis.

CIDECAR passengers are getting more exacting in their demands every year, and he is indeed a lucky motor cyclist who can thoroughly satisfy his passenger. Even with the introduction of hoods and screens, the requirements of many lady passengers

are not quite filled. If one fits a screen, then it is found that there is a slight draught on the inside, and a slight draught is worse than half a gale, so side curtains are arranged. Then before many days a hood is fitted, and, like all Cape cart hoods, it is found exceedingly difficult to exclude draughts from the side or between the gap. between screen and hood.

Mr. Atkinson, of 84, Mickleton Rd., Coventry, has tackled the passenger-comfort problem and has solved it by a coupé sidecar. He has also attacked the question of leg - guarding, and here again he has successful,

although perhaps at the price of appearance. illustration shows this motor cyclist's 6 h.p. Rex fitted up for the winter.

A Coupe Sidecar Body.

The coupé is qui one of the best looking bodies we have seen. Usually, such bodies have a very box-like appearance, which is absent here. All windows are glass, and the two side lights are made to drop into pockets. A child's seat is also provided, which was illustrated in our issue of December 4th (page 733).

One would naturally conclude that such a body would be unduly heavy, but this is not so. In fact,

Mr. Atkinson uses a folding sidecar chassis and removes the body every time he returns from a ride.

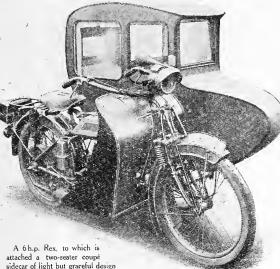

The leg-guard is built up of threeply wood and American cloth, and, while a good number of riders would not care to fit such a guard on the score of appearance, there is no doubt about its effectivenessin fact, it is perhaps surprising that some such device has not been made by enthusiastic London-Exeter competitors

 II'^{α} understand Mr. Atkinson is prepared to make a limited number of his coupé sidecar bodies should

any reader of The Motor Cycle require such a vehicle. The fact that private motor cyclists go to the trouble and expense of providing means to combat weaknesses of standard design reveals the need for greater attention on the part of designers to these questions of

comfort. We think a little experimenting will prove that a draughtless sidecar can be produced without

resorting to a coupé body.

USEFUL EQUIPMENT FOR MOTOR CYCLES.

A Selection of Useful Novelties for the Motor Cyclist's Needs.

Economical Storage.

CHARGES for the garage of a motor cycle are so high at the present time that any building, however small, which will just house a motor cycle, and may be purchased at a moderate price, is bound

to interest our readers r Messrs. D. Parker Wheeldon and Co., 126, Bishopsgate, London, E.C.2, have lately placed upon the market various sizes of motor cycle "Flexproof," a flexible glazed waterproof canvas attached to a wooden frame. The buildings are sent out complete with fastenings, and when erected are rigid and stable in any wind. Each side is hinged to the next, and the roof is hinged in two parts, so that any side or sides may be opened simul-taneously, and no matter how heavy may be the machine, it can be easily handled.

These buildings may be had with floors at a small extra charge.

The same company are also prepared to quote for full size motor cycle houses, constructed entirely of wood.

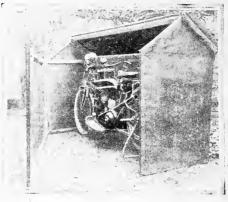

A Child's Sidecar Seat.

There are quite a large number of motor cyclists who have to provide accommodation for a child, and nuless a special two-seater sidecar is used, usually

Famous child's ceat for sidecars.

the methods applied are of the makeshift order. It is not everyone who desires a two-senter sidecar, especially if the child be, say, under five years of age. On the other hand, it is fatiguing for the passenger to "nurse" the child,

Portable motor cycle shed of waterproof canvas.

Mr. S. Banton, of 4, Windsor Street, Coventry, has overcome these difficulties by providing a detachable child's seat, which can be fitted to almost any coachbuilt sidecar without structural alterations, except the fitting of a metal socket in the floorboards. Into this is placed a tubular standard supporting the seat, a coil spring being interposed to absorb any vibration at this part of the sidecar floor. The seat itself is circular, and consists of a well-made spring cushion, at the back of which are two eyes; through these are passed the two uprights supporting back rest. The price of this seat, which is exceptionally well-made and finished, is 45s.

An Ingenious Motor Cycle Repair Bench.

All motor cyclists who repair their own machines, and who are fortunate enough to own a motor

house, know how tiring it is to work continuously at a machine in stooping position. For this reason all works are equipped with special benches, on which motor cycles are erected, but few amateurs have taken the trouble to make these benches, and when they have made them are unable to get the modern machine in position on them without assistance on account of its weight.

The patentee of the beach illustrated has overcome this difficulty, and, moreover, he has made his bench so that when out of action it may be stood up in a corner of the motor house, and will occupy very little space, as the legs fold close up against the table.

fold close np against the table.

The bench is provided with a neat little drawer, in which tools or odds and ends may be stored.

The repair bonch is at present handled by Messrs. A. E. W. Gwyn, Ltd., 5. Budge Row, London, W.C.4.

A British-made Mechanical Horn.

It is gratifying to note that the number of motor cycle mechanical horns which are being made in this country is increasing. One of the latest is that sold by Messrs. Ramsay Brothers and Co., 245, Oxford Street, London, W.1. The

A mechanical horn sold by Messrs Ramsay Bros. and Co.

mechanism is contained in a brass casting, and it is of extremely simple construction, consisting of a serrated wheel driven by a rack and pinion, the pinion being rigidly fixed on a cross-shaft. On the same shaft the serrated wheel is loosely mounted, and is provided with a pavl with which the pinion engages, allowing the wheel to be driven in one direction only, the return of the rack having no effect.

Portable erecting bench marketed by A. E. W. Gwyn, Ltd.

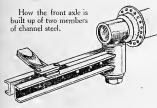

MOTOR CCLE

A Light Four-wheeler.

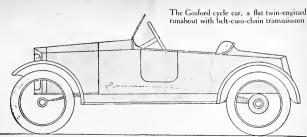

A Sidecar Alternative on Well-tried Lines.

WHEN a belt is used in the transmission of a cycle car it is usually the rule to make it the medium of the secondary drive, the primary being by chain. This was the "standard" practice of all those pseudo-designers who tilted at the cycle car problem in 1911 and 1912, but one large firm reversed the order of things, and made the belt serve as the primary drive with a chain to the axle.

At the time this system was subjected to derision on the part of those who took the motor cycle as its pattern, but it was recognised by *The Motor Cycle* that if a combination of chain and belt was to be adopted successfully for propelling light four-wheelers, then the beth should be used under more ideal conditions than those

that prevail when comparatively slow belt speeds are used. Belt drive can be made perfectly satisfactory if it is run fast. By making it the primary drive, not only is the speed high, but it is not subjected to the load as when it is the secondary transmission. Further, when a second or a third ratio between engine and road wheel is used the speed of the belt is not decreased, which is the case

when the belt is used from the countershaft to the road wheels. In the latter system the speed of the belt is lowest when the greatest efficiency is required.

when the greatest ethiciency is required.

Mr. W. E. Boyes, of the Gosford Engineering Co., Stoke Green, Coventry, in evolving his simple runabout evidently agrees with us on this point, for the transmission of his vehicle is by lin. belt from the engine to the gear box and by single chain to the live rear axle. By doing this Mr. Boyes secures one other advantage not previously referred to, viz., the removal of one of the chief objections to the use of a primary chain drive, i.e., its noise. The belt can be run quite slack, and, being under a light load, it is claimed that belt slip and broken fasteners are eliminated.

Unusual Frame Construction.

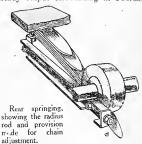

The experimental Gosford cycle car we have examined is a neat little runabout, and the "production" vehicle will be even neater. As will be observed from the illustration, it is nicely proportioned A Coventry Victor air-cooled flat twin is used as the power unit, and this is

A Coventry Victor air-cooled flat twin is used as the power unit, and this is placed with its crankshaft across the frame, driving a modified Sturmey-Archer gear box fitted with a hand-starter operated from the seat. From the gear box the drive is by a comparatively short chain to a live axle supported in large ball bearings, the mountings of which

carry quarter-elliptic springs. Radius rods of angle steel are also connected to the ball bearing bousings in a manner permitting of easy chain adjustment.

The frame is of channel steel with cross members of the same form, which is also used in the construction of the front axle. The latter is rather unique, and consists of two steering heads having flat arms on their sides which are riveted to two channel members placed back to back. Quarter-elliptic springs are used also at the front. The weight is 5 cwt.

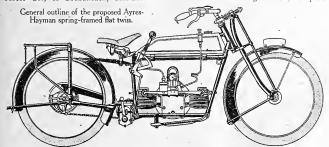

We are advised that the price with hood and screen will be £160, and that arrangements are well in hand for a small but steady output commencing in February.

A SPRING FRAME OPPOSED TWIN.

A LTHOUGH at present in very little more than "the paper stage," the Ayres-Hayman motor cycle, illustrated, will shortly be placed on the market by its designers. The Viaduct Motor Co., of Broadheath, Manchester.

Its chief feature is its spring frame. This frame is of the duplex type, carrying the Coventry Victor engine on parallel members. A single top tube is embodied, which is enclosed by the saddle tank. The engine unit, complete

with silencer and footboards, may be removed by taking out two bolts only.

Probably the most interesting point in connection with the design is the fact that the rear wheel frame is hinged in front of the gear box. This means that, while in most designs the rear chain is constantly varying in tension with the movement of the wheel frame, in this design it is the front chain that is affected. In fact, the variation would be negligible, even with the full movement of the wheel. This system, of course, increases the unsprung weight, but the gear box is located so near the spring portion of the frame that its effect should be negligible.

The specification includes Coventry

The specification includes Coventry Victor flat twin engine. 75×78 mm. (688 c.c.), T.B. magneto, Brampton Biflex forks, 28×5in. tyres, and XL'All H27 saddle. The gear box has been designed by Messrs. Ayres and Hayman, and will be described later. The price with side-

car is 148 guineas.

UR roads have latterly carried an unusually high percentage of inexperienced motor cyclists, and these notes are inspired by what the writer saw during a summer tour. We are permitted by a lazy Government to take high-powered projectiles on the public roads without any previous training or instruction; and since very few of our highways are really suited for fast traffic, it is surprising that more accidents

RIDING HINTS FOR BEGINNERS.

An Expert's Suggestions, chiefly Concerning the Art of Cornering.

BY ROAD RIDER.

Quite experienced riders are sometimes at fault in approaching a sharp or blind corner, especially if the corner turns to the left. Legally, of course, we are supposed to approach corners on the near side of the road, i.e., the left hand. But we soon find that if we hug the near side of a blind left-hand corner, we get a very poor view round it. So some men form the habit of approaching a left-hand corner rather wide, i.e., on the centre of the road, or even a little over towards the off or right-hand side, under the supposition that this approach gives the best view, and gives

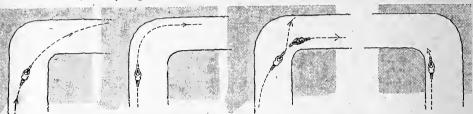

Fig. 1.—"Cutting" a corner

Fig. 2.—Correct way of taking a right-hand corner.

do not occur. These notes cover a few points which

Fig. 4.—" Hugging " a left-hand corner. Wrong, because ride gets no view till too late

plenty of freedom to act in emergencies. That is very true. It is equally true that if a flustered novice meets a rider who is approaching a left-hand corner wide, the novice may quite probably cut across to the inside of the bend. The expert will simultaneously turn in to that side, and a pretty smash will result. Under no circumstances, therefore, should a rider quit his proper side of the road in rounding a blind corner. He should not hug the near side of a left-hand bend; but he should not swing out as wide as the centre of the road, or

would form part of a licensing examination if we were better governed.

How to take Corners.

The first essential in road work is the ability to take corners properly. The commonest cause of accidents upon corners is "cutting," which may lead to a smash at a very easy bend if two fast vehicles are concerned. Fig. 1 depicts this evil but common practice, and fig. 2 shows the rider's correct course. "Cutting" is

usually due to thoughtlessness -the rider takes the shortest way without considering what will happen if he meets another machine which is keeping on its proper side; this contretem bs is indicated in fig. 3; the "cutter" is forced outwards by the correct rider, and his only safeguard depends on his being able to stop; if he is travelling at all fast, he cannot wrench his machine round far enough to negotiate the bend after swinging past the machine he has encountered.

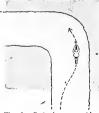

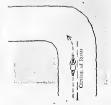

Fig. 5.—Swinging too wide round a left-hand corner. Rider is on his wrong side of the road.

trespass on the off side of it.

Fig. 3.—The " cutter " meets another machine and is forced into the hedge.

Fig. 6.—Correct way of taking a left-hand corner. Rider is swinging wide without quitting his proper side.

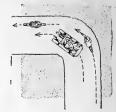

Fig. 7.—Overtaking another vehicle on a corner is unpardonably reckless.

Riding Hints for Beginners .-

Fig. 8.—When motor cycles had single gears the correct way of taking open hairpins was as in fig. 8, to avoid the steep gradient indicated by the shading.

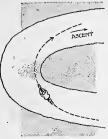

Fig. 9.—But open hairpins are often taken as in fig. 9, as horsed traffic may have cut up the outside of the

Overtaking at a Corner is Dangerous.

Another fertile source of accidents is overtaking round a corner, as shown in fig. 7. For many years all trials regulations imposed heavy penalties for this corrupt practice, though I do not recall a case of such penalties being enforced. The sketch demonstrates that if a third vehicle meets the two which are passing each other on a bend, an accident is inevitable unless two of the parties are travelling so slowly that

they can stop dead.

Broadly speaking, safety on corners is a matter of low speed. It is not an uncommon experience to meet a big vehicle driven so carelessly that an instant stoppage on the very brink of the ditch is one's only resource, even if one is driving perfectly. Beginners should remember that we can never count with certainty on sufficient fairway for even such a narrow machine as a motor cycle. Sheep or cattle or a motor char-à-bane may fully block quite a wide corner. A farm waggon or a Ford car may seal up a bend in an ordinary lane. Very slow driving, a correct course, and plenty of hooting are the best insurance policies round corners.

Open Hairpins on Hillsides.

The only exceptions to the standard rules of cornering occur on open hillsides, where the complete course of a very bad hairpin is fully exposed to view. The proper method of taking these hairpins, several of which will figure in any modern trial, has completely changed of late years. A few years ago we tackled these terrors on single gears, and our main anxiety was to prevent the combination of gradient and corner from causing our engines to konk out; the bend slowed us down to 10 m.p.h. or so, and the gradient then stalled the engine, which at low road speeds developed

Fig. 10 -Cross section of a country lane which requires care.

Fig. 11.—A triple-rutted lane which is very difficult to negotiate.

Nowadays we have bottom a minimum of power. gears of 12 to 1 or so, and we need no longer take the longest path round a hairpin in order to avoid the i in 3 grade across the elbow. Consequently our business is to change into bottom gear as soon as we approach the hairpin, and then determine the course simply and solely by the surface. Surface affects us in two ways; in the first place we desire the back tyre to grip, which it cannot do upon grease, big stones, or heavy mire. Secondly, it is not easy to steer a 3 cwt. machine at 8 m.p.h., so we must avoid the rougher bits for fear of our steering becoming uncontrollable. Generally speaking, the long way round a hairpin is usually the roughest, because descending and ascending horse traffic avoids the inside of the elbow and cuts up the wide swing.

Treacherous Roads.

The less easy types of surface are full of terrors for novices—grease, tramlines, and the like. But I devote no space to the more obvious dangers, since everybody knows that turns and variations of speed require caution on grease, and that tramlines should only be crossed at a blunt angle. Fig. 10 indicates a very dangerous type of road, which sooner or later catches most novices napping. In cross section it consists of a high, broad crown, with deepish ruts on either side, and is unusually common just now, as the stone men have not levelled up the ruts during the war. The beginner sees that the centre is fairly wide, and he travels fast. Sooner or later a big stone

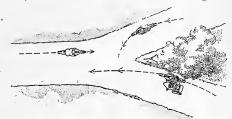

Fig. 12.—Illustrating a dangerous point where three roads meet.

or a moment's carelessness jerks him off the crown into one of the ruts, and he enters the rut with a wobble on. When he tries to correct the wobble, his front wheel hits the side of the crown at an acute angle and is more or less chocked: if the machine is travelling fast, the rider will inevitably come off. Fig. 11 illustrates an even worse type of road, made of such soft stuff that the horses feet have cut a third rut down the centre. I know of no graceful or comfortable method of tackling such a stretch: slow speed with trailing feet is about the best we can manage.

Contrary to general belief, the easiest method of tackling rough stony going, such as we meet on moor-land tracks in open trials, is to take it fast. Some courage is required at the first experiment, but it soon educates the rider. When first confronted with a patch of real A.C.U. going, the novice slows down. Each hump, stone, or pot-hole deflects his steering at the low speed, and his progress is a spectacle for gods and men. Tackle such a piece of road at double or treble the speed, and the heavy machine will plough

Hints for Beginners,-

resistlessly through with a steady helm. Of course, such work is bad for the tyres and wheel rims, and is sure to shake loose any part which is not properly_

Fig. 13.-Another dangerous road junction.

secured; wherefore it is wise to inspect the machine minutely at the end of such a section.

Road Junctions.

These notes may well conclude with a special warning about places where three roads meet. The merest pinch of road experience teaches a man to be careful where four roads meet, and broadside collisions destroy the impatient. But a three-way road junction presents more subtle problems. The special peril lies in the fact that the angles are often easy, and that two riders may meet at quite high speeds without any danger arising; but possibilities of trouble are always present if three riders reach the junction simultaneously from opposite directions, whilst a man who is coming down one arm of a Y and intends to turn back up the other arm is often in a very helpless position if anybody plays the fool. The sketches make obvious some of the more perilous possibilities which may arise at such junctions.

FRENCH NOTES.

Details and Commen's Concerning Continental Motor Cycle Events.

WELL-FILLED sporting programme has been prepared by French motor cyclists for the coming season. Starting in February with the reliability competition from Paris to Nice, there will be important events right through the season, when the Gaillon and Gometz hill-climbs will be held in the month of October.

Not only is the sporting calendar well filled, but there is every indication that competitors will be numerous and competition keen in all the leading. events.

Two Outstanding Events.

The two outstanding events of the year are the motor cycle and cycle car Grand Prix at Le Mans and the Six Day Trials in the Alps. Both of these were on the programme for 1914, but had to be abandoned owing to the war. They are of an entirely different nature, the Grand Prix being a long-distance road race over a very fast level course, and the Six Day Trials being a reliability test with hill-climbing competitions of a severity altogether unknown in England.

While all the races and competitions are under the control of the Union Motocycliste, which is the controlling body in France, the race at Le Mans and the Alpine trials have the distinction of being organised directly by the national body. In the case of the race, the Union leaves the detail organisation in the hands of the club at Le Mans, this being one of the most powerful and energetic provincial automobile clubs in France; but at the same time it interests itself in the organisation and takes an active part therein.

As an indication of the interest which is likely to be shown in the Grand Prix race at Le Mans, it may be mentioned that in 1914 considerably more than 100 entries had been received for the motor cycle and cycle car events. This number should be exceeded in 1920, for interest in motor cycling has grown enormously since the war.

French representatives of English machines undoubtedly will take part in all the leading French races and trials. It is to be hoped, however, that the home factories will see the necessity of participating directly in these trials. There is no doubt that natural conditions in France make any event in that country much more severe than a similar event at home. The run from Paris to Nice, for instance, when undertaken in the month of February, causes competitors to face odds which are uncommon on English main roads. The French roads are so straight that competitors are tempted to drive fast, and they are so rough that unless the machine is really well built it will break down under the trial.

The Grand Prix at Le Mans may be likened to a long distance race at Brooklands, with all the hazards of the road thrown in. For an English machine to win the Six Day Trials in the Alps would be the highest testimony of sound design and good construction that it would be possible to obtain. Continental firms believe they are supreme for this class of work, and they certainly have the advantage of being acquainted with the conditions and knowing the roads thoroughly. In their own interests English firms should come forth and show that they are not afraid to face the most strenuous conditions.

A Three-wheeler with Shaft Drive.

Details of the T.B. Runabout illustrated in our Issues of November 13th and 20th.

PROBABLY the production of a successful three-wheeler involves more careful designing than that of a four-wheeler. Especially is this the case when all shaft transmission is embodied, and more than one machine, designed as a three-wheeler, has eventually developed a fourth wheel.

Many pre-war three-wheelers were doomed to failure from the outset, because the designers had been led astray by the apparent simplicity of such machines, but one has only to glance at the chassis of the T.B. runabout to see that the usual obstacles were fully appreciated by its designers. The result is not "a simple

mately parallel members of the former, and placed at an angle to it. The front ends of these tubes connect with a second transverse member of the frame, and support the quarter-elliptic front springs. Looking at the machine from above, the structure appears to be rather complicated—an impression increased by the twin exhaust pipes—but a closer examination reveals the fact that this is more apparent than real. If the propeller-

at the front end to prevent the wheel from canting. A duplex torque rod, connected at its inner end at a point ou the centre line of the machine, is attached to the bevel gear easing. The engine adopted is the 8 h.p. J.A.P.,

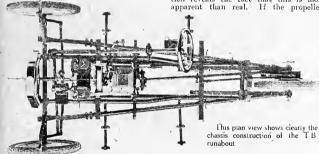

The engine adopted is the 8 h.p. J.A.P., on to which is built a two-speed and reverse gear box of conventional type. Between the two is a cone clutch and gear wheel for the handle starting mechanism, the starting shaft itself being placed between the two cylinders. At the rear end there is a gear wheel, which, when required, engages a similar wheel on the engine shaft, but when not in use is drawn out of mesh by a coil spring.

Immediately behind the gear box there are a brake drum and a large diameter fabric universal joint, which takes up the misalignment of the drive caused by the engine being on the centre line of the vehicle and the necessity for the shaft to be taken to one side of the rear wheel.

The final drive at the wheel is by

bevel gear.

Although the price quoted for this interesting machine is only £200, the equipment is very complete, and includes a spare wheel, hood, screen, horn, lamps, tools, jack, and pump. The manufacturers, Thompson Brós. (Bilston), Ltd., Bilston, Staffordshire, anticipate being in a position to commence deliveries almost immediately.

job," but one which should go a long way to eliminate rolling and rear wheel cauting.

As will be seen from the photographs, the engine and gear are built up as one unit, which is carried in a long tubular frame supporting at its fore end the dummy radiator (used as a petrol tank). At the rear end of this frame are pivoted two inverted semi-elliptic springs used as "cantilevers." The forward ends of the springs slide in a large transverse member of the frame, the rear ends being shackled on the ends of the rear wheel frame.

Outside the main frame are two tubes merging from the rear of the approxi-

shaft, torque rod, rear springs, and exhaust pipes are removed, the frame assumes a much more simple appearance. A rather long frame is used to carry the rear wheel, and it has wide bearings

The 8 h.p. air-cooled J.A.P. engine, three-speed gear box and shaft transmission. The gear wheel for starting purposes will be observed immediately behind the cylinders.

THOUGH few people know it, there is a prodigious waste of carbide among

users of this source of lighting power. Nine people out of ten fail to extract the full value from their carbide, when, as a matter of fact, it can be made to last considerably longer if carefully bandled. How many people, after using a charge once, or, maybe, twice, throw away what is left without sorting it? More often than not it will be found that this apparently exhausted residue contains lumps, which have what can only

CARBIDE ECONOMY.

be termed a dry "core." These are still a potential source of light. Here is a tip which will save the carbide user money—and carbide—over and over again. Procure an ordinary tin can of any convenient size, preferably with a lid. Punch or bore several small holes in the bottom, very little discretion being necessary to know how large the holes ought to be made. Then, instead of emptying the contents of your generator straight on to the rubbish heap, pour it into the improvised separator, which

should be well shaken a few times. The dust will soon disappear, but usually quite a useful bit of carbide, fit for further service, still remains in the box—enough to make the experiment well worth while, and undoubtedly a considerable saying to the frequent user.

Another point, too, is worth considering. Unused carbide, if exposed to damp, gives off a highly inflammable gas, which becomes a dangerous explosive when mixed with a suitable amount of air. The plan recommended avoids this danger.

COMPETITIONS IN 1920.

Provisional List of Inter-club, Open, and Other Events, to be held during the Forthcoming Year.

For the first time, competition dates for the year have been arranged by the A.C.U., in co-operation with the class concerned, with a view to avoiding the deplorable state of affairs last year, when the dates of so many comparatively important events clashed. The twenty open events which will receive permits from the A.C.U. and the support of the "'rade" are included, as are also the Brooklands meetings of the B.M.C.R.C. which were absent last very

Scooter Trial.

Scooters entered for the French scooter trial, to take place next April, must be provided with serviceable mudguards and two brakes.

Too Fast at Horsham.

Complaints having been made of motorists driving at excessive speed through Horsham, on the London-Worthing road, this matter has been under the consideration of the local authorities.

Calendars.

We have received a very tasteful calendar from the D.R. Engineering Co., Dunfermline, who ask us to state that, while the stock lasts, they will be pleased to present these to any ex-D.R.'s who care to apply.

Misrepresentation.

We understand that someone representing himself to be an engineer and a traveller for the firm of Douglas Motors, Ltd., is obtaining orders and deposits for Douglas motor cycles in the Cardiff-Newport district. This gentleman bears an Irish name, and has no connection with Messrs. Douglas Motors, Ltd., who will be glad to have further information concerning him.

Police Traps.

We have received information of a police trap working on Shooters Hill Road where the road joins Blackheath Common.

A police trap is in operation on the Heaton Moor Road. Motor cyclists should go warily, as a correspondent states that be has been a victim although he was travelling at the same speed as a tramear.

French Import Duties.

French import duties have just been reduced from 70% ad valorem to 45% ad valorem. This announcement dates from December 23rd, the date of the signing of the official decree. There are indications that France would reduce her rates to 55\% ad valorem to England, Belgium, and Italy, it the United States were to make their tariff the same as the other Allies, but while the U.S. tariff remains at 45%, there is not much likelihood of the French tariff being any lower.

Wanted, Triumph or Good Make.

Under the heading of "Wanted," the following advertisement recently appeared in a provincial daily: "Triumph motor cycle or good make; 1918-19; 40-50 h.p." No doubt the Triumph Co. will appreciate the humour as muyone.

Modern Road Surfaces.

The Ministry of Transport has appointed a Select Committee to investigate the complaints which have recently been made from all quarters by horse owners of the unsatisfactory footbold afforded horses on modern smooth roads.

To Help St. Bartholomew's Hospital.

In last week's issue we referred to a scheme originated by Mr. F. Asiett Coulson, the maunifacturer of the Coulson motor bicycle, who has suggested to various makers of motor cycles that they should present one of their machines, to be sold by auction by Mr. George Robey, to help swell the depleted funds of London's most famous hospital.

The accompanying photograph shows Mi. George Robey, O.B.E., who has done much charitable work during the war, and Mr. Coulson, the originator of this happy idea. The machine is a spring frame single-gear Coulson two-stroke.

Special Features.

THE 1920 SIX DAYS.

A PLEA FOR LARGER ENGINES.

COMPETITIONS IN 1920.

No Rear Light.

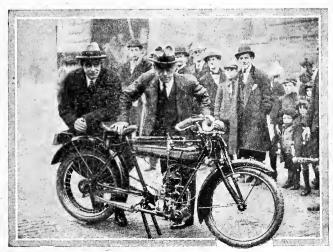

At Feltham recently the rider of a scooter was fined 10s, for not having a rear red light. This, we believe, is the first case of a motor scooter figuring in a police court.

Bad Road Censure.

At an inquest at Portsmouth on a naval officer who died from injuries caused by his motor cycle skidding, the jury considered the Tramways and Itoads Committee of the Council deserved the severest censure because of the bad state of the roads. The Portsmouth Council, however, is not the only authority deserving censure on this score.

The Institution of Automobile Engineers.

The next meeting of the London Graduates of the Institution of Automobile Engineers will be held to-day, Thursday, January 8th, at the offices of the Institution. 28, Victoria Street, London, S.W.I. at 8 p.m., when Mr. Thos. Clarkson will deliver a lecture on "Steam Vehicles."

Mr. Geo. Robey, O.B.E., and Mr. Coulson with the Coulson two-stroke that the former will offer by auction in aid of St. Bartholomew's Hospital.

MOTOR (YCLE

Scottish Motor Show.

The Scottish Show, at Kelvin Hall, Glasgow, opens on the 23rd and closes on the 31st inst.

The £100 Car.

Once more the "Car for the million" has appeared in the lay press. The poor man's car, it is called, and sells for \$2100. An illustration depicts it being carried by two men, its light weight being an advantage, it is claumed, when it breaks down. This is where it scores over a Rolls-Royce.

Patents in 1919.

In 1919 the number of applications for patents was 32,892—a record figure. 1913 the number was 30,077, and in 1915 only 18,191 were filed. Judging from the number of queries regarding patents that we are receiving from readers it would appear that 1920, too, will prove a record year for motor cycle patents.

Clubs Amalgamate.

The proposed amalgamation of Burnley and Preston Motor Cycling Clubs with the Blackburn and District Club was carried a step further at a meeting on Friday, when it was decided to change the name of the Blackburn Club to that of East Lancashire Motor Cycling Club. The area of the club's future activities will thus be considerably extended, and will embrace all East Lancashire and North-East Lancashire towns.

Cycle Car Design in France.

A French contemporary has taken a referendum on the subject of cycle car specification, and the trend of opinion is as follows: Air-cooled twin cylinder, V or horizontally opposed engine, cooling fan, four road wheels, change-speed gear of the sliding type, and final drive by enclosed chain. Most French enthusiasts expect a machine of this type to be sold at 3,200 francs (£128), which, our con-temporary rightly says, is practically impossible under present conditions.

The Paris-Nice Reliability Trial.

Already fifty-five entries have been received for the Paris-Nice motor cycle reliability trials, to be held from February 13th to 16th. British manufacturers are well represented, the makes entered for this event being Triumph, James, A.B.C., Scott, Matchless, Douglas, G.N., Dot, Sunbeam, Rover, Royal Enfield, and New Imperial. Among the new French firms which have taken to motor cycle construction since the war are Georges Lévy, Louis Clement, Motosolo, and Janoir, all of which have entered complete teams. The American makes entered are Excelsior, Harley-Davidson, and Indian.

At the last meeting of the Union Motocycliste de France some changes were made in the rules governing the Paris-Nice run. The secret controls have been abolished, and several parts which were not originally intended to be sealed must now be stamped before the start. Among these are belts, chains, belt fasteners, chain links, frames, sidecar attachments, and sidear springs. A maximum of twenty points will be given to riders not making use of any of their spare parts, and two points will be deducted for every spare part used. The cleanliness equipatition has been shalled. ness competition has been abolished.

London-Exeter.

We have received a letter from Mr. E. F. Chidley, who competed in the London-Exeter Trial on a P. and M. sidecar, who points out that through a misunderstanding on his part he was credited with having completed the course. As a matter of fact, he retired at Salisbury.

The Coventry and Warwickshire Club Dinner.

A winter run of the above club was held on Saturday, January 3rd, members gathering at the Coach and Horses Hotel, Coleshill, where a dinner was given in honour of the team who won the M.C.C. nonour of the team who won the M.C.C. Team Trial trophy. The affair was most successful, and Mr. Edward Manville, M.P., president of the club, took the chair and presented the prizes. The club's 1920 programme is to be a very energetic one, and Mr. N. Ryecroft has been appointed hon. sec.

Sreatham and District M.C.C. Dinner.

The Streatham and District M.C.C. will hold its annual dinner on January 31st at Frascati's Restaurant, London, W.

Motoring Danger Removed.

The objectionable practice of stone throwing by boys has recently again become a serious menace to motorists in various parts of the country. The Royal Automobile Club are accordingly devoting special attention to this matter, and would be glad if motorists would inform them of any habitual instances of which they may know.

Advertisement Editor Wanted?

In the advertisement columns of a contemporary we read that a satisfied owner of a car has been driving cars for about eighty years, but we have failed to get into communication with him in order to persuade him to record his impressions of the cars of 1840

LONDON-EXETER RESULTS.

OF the 148 entries, 125 started, and 93 completed the journey. Three other competitors incorrectly signed the checking sheet at the finishing point, although they had not been to Exeter.

Fifteen men were disqualified for being fifteen or-more minutes ahead of time.

The following table gives an analysis of the entries and of the awards of 54 gold and 25 silver medals:

	Entres.	Non-starters.	Non-finishers.	Gold Medals.	· Silver Medals.	Disqualified.
. lotor cycles	36	5	3	9	8	6
Motor cycles with sidecars	72	IC.	Lf .	29	15	1
Cycle cars, light cars, and cars	46	8	8	16	.3	5
Total	148	23	32	* 52	26	15

One complimentary gold medal is also awarded to Mr. R. H. Head, the judge of the competition

Particulars of the car performances will be found in this week's issue of our sister journal, The Autocar.

A Miniature with Pressed Steel Frame.

A Scooter with its Engine Hidden below the Platform.

A LTHOUGH designed to meet anticipated demand for motor scooters the little machine illustrated is tall intents and purposes a miniature motor cycle, as the capacity of the engine is 232 c.c. and a saddle is provided.

In designing the Marseel scooter, as it

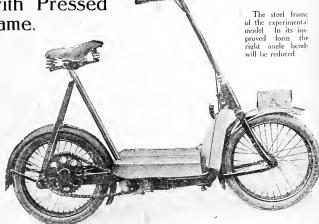

In designing the Marseel scooter, as it is named, the makers have aimed to produce a light runabout machine, comparatively cheap to buy and run, and extremely simple in operation. Bearing in mind that the potential buyers of such machines are not mechanical, the designers have endeavoured to make the mechanical elements as inconspicuous as possible. Thus when seen from the eye level of an adult the machine has the appearance of being a seat type scooter minus an engine. This is due to the fact that the power unit is located below the platform, and the tank takes the form of a shallow how acting as a front shield.

of a shallow box acting as a front shield. The experimental machine illustrated has been on the road nearly twelve months, and in the "productin" mode's, which, it is expected, will be ready next month, there will be several improvements, including a "cleaner" design frame of pressed teel.

A Simple Frame.

It will be observed that the frame is composed of two steel members, which are bolted to the east steering head and splay out to enclose the approximately triangular tank. From this point they form the supports for the platform, converging again to the crank case of the engine which acts as cross members. At the rear of the engine the steel plater form the chain stays. In the experimental frame there are an unnecessary number of right-angle bends, but in the improved model these will not appear, the two side plates being shaped in sweeping bends.

The engine—a two-stroke with roller bearings throughout—lies horizontally in

the frame with its exhaust pipe on top, a recess being made in the platform to receive it. The C.A.V. magneto is coupled directly to the crankshaft through a leather joint, and is carried on an aluminium plate supported from the crank case. Located alongside it, and also under the platform, is the carburetter—a single-lever instrument of extremely simple design.

Chains are used for the transmission, the main drive being from the crankshaft to a small countershaft running on a bronze bearing contained in a quadrant plate pivoted on the right side "chain stay." Chain adjustment is effected by swinging the plate slightly.

A compression release is fitted on the cylinder head, and is operated by a small pedal intended to be actuated by the right heel.

To provide support for the saddle, a tube is used, triangulated with the chain stays by two flat steel strips. This support has a lug on its lower end connecting with the main frame by one of the engine

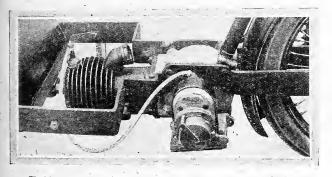

bolts. The price of the machine is £33. and the makers the Marseel Engineering Co., Victoria Park, Coventry.

The design is fully covered by patents, both as regards the frame construction and the countershaft adjustment.

AVERAGE SECOND-HAND PRICES

AS is often the case at this time of year, it has not been possible to give such a complete list as is usually presented. In all probability those riders who have machines on order are retaining their present mounts until they see some definite signs of the delivery of the new ones; owing to this state of affairs, there is likely to be a keen demand for the good second-hand machines available. Most wise riders at the present time are holding on to their machines in the belief that a 'bus in the garage is worth two on a waiting list.

The Marseel miniature, in which the engine is placed horizontally under the platform.

A THREE-CYLINDER RADIAL ENGINE.

The 3 h.p. Beaumont Motor Cycle having a Unique Power Unit.

ERO practice has been the subject of many glib references during the past few years, but comparatively few manufacturers have closely followed aircraft

engine design up to the present. We have had the products of Beaumont Motors, Ltd.,

Park Lane Mills, Leeds, under our observation for some time, and have lately seen the parts of this interesting little power unit. We also inspected an experimental machine, which well on the way to completion. The crank case is of cast iron, and embodies the three cylinder barrels in the same casting. Aluminium is used for the detachable cylinder heads, and these are held down by a number of small screws.

No caps are fitted, access to the valves being obtained by removing the heads bodily. Small set screws in the cylinder walls retain the valve pockets, and it will be noticed that the valves and springs are entirely enclosed in the cylinder castings; on removing the screw the whole valve assembly and seating may be withdrawn.

At present it is not possible fully to describe the entire internal mechanism, but it suffices to say that the crankshaft runs on plain bearings, and that aluminium slipper type pistons are employed. The valve cams are formed on the outer circumference of internally toothed wheels, and the carburetter is attached to the base of the crank chamber,

the induction system being self-contained without external pipe work.

A heavy flywheel is not fitted, the engine being at present equipped with a steel fan of fairly sturdy construction on the exhaust side.

onnumentalininennetrili · committee or minimum or management of the contract of the co

The three-cylinder 3 h.p. radial Beaumont engine, which has all valves enclosed in the cylinder casting.

The magneto and transmission sprockets are on the inlet side of the engine, and when we inspected the machine the final transmission had not been fitted, while the ideal gear ratios have yet to be chosen.

A single-cylinder magneto is used, driven at one and a half times engine speed. Distribution is effected in a rather unusual manner. A Runbaken magneto is used, and it will be recollected that the hightension lead on this instrument emerges at the centre of the end plate opposite to the driv-ing end. The terminal is replaced by a bronze gear wheel on the armature shaft, and the distributer housing contains an internally toothed ring. Between the ring and the wheel rolls a bronze pinion, and as this passes over insulated segments in the former the hightension current is led to them

> segments. During our inspection the engine was several times started by swinging the fanflywheel, and the maximum revolutions were quite extraordinarily high.

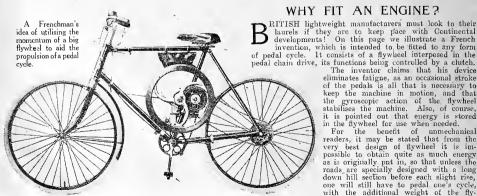

one by one. The high-tension wires are connected to these

Vibration was noticeably absent, for although the engine was only mounted in a bare frame, resting on the front wheel and rear stand, and was in turn placed upon a compara-tively light wooden erecting bench, the machine showed no tendency to jump about, even at the highest rates of revolution.

The whole machine will un-

cylinder casting.

donbtedly attract great attention on account of its decided renunciation of standard motor cycle practice. In the near future we hope to subject one of these machines to a severe road test, and our readers will be duly informed of the results.

WHY FIT AN ENGINE?

RITISH lightweight inadulacturers must look to their developments! On this page we illustrate a French invention, which is intended to be fitted to any form of pedal cycle. It consists of a flywheel interposed in the pedal chain drive, its functions being controlled by a clutch.

The inventor claims that his device

eliminates fatigue, as an occasional stroke of the pedals is all that is necessary to of the pedals is all that is necessary to keep the machine in motion, and that the gyroscopic action of the flywheel stabilises the machine. Also, of course, it is pointed out that energy is stored in the flywheel for use when needed. For the benefit of numechanical readers, it may be stated that from the two these telegraphs (flywheel it is in

very best design of flywheel it is impossible to obtain quite as much energy as is originally put in, so that unless the roads are specially designed with a long down hill section before each slight rise, one will still have to pedal one's cycle, with the additional weight of the flywheel, clutch, and gear.

New Name. The Acme, J.A.P.-engined Big Twin-

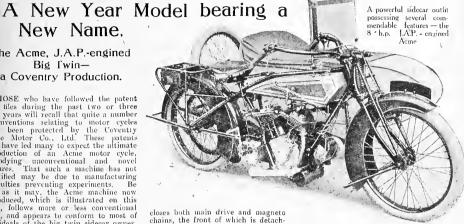

a Coventry Production.

THOSE who have followed the patent files during the past two or three years will recall that quite a number of inventions relating to motor cycles have been protected by the Coventry Acme Motor Co., Ltd. These patents may have led many to expect the ultimate introduction of an Acme motor cycle, embodying unconventional and novel features. That such a machine has not fructified may be due to manufacturing difficulties preventing experiments. Be this as it may, the Acme machine now introduced, which is illustrated on this page, follows more or less conventional lines, and appears to conform to most of

the ideals of the big twin sidecar owner. the sa' handsome machine, having a sloping frame, 28×3in, quickly detachable and interchangeable wheels, with a rather long wheelbase-a feature which, in con-junction with the large diameter and section of the tyres, should make for exceptionally easy riding.

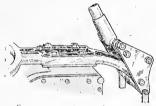

Unusual Magneto Drive

The engine fitted is the 8 h.p. J.A.P. adapted to the special requirements of the Acme Co. He.e lies the chief nove'ty, for the magneto is driven from the main drive side of the engine, and not from the timing gear, as is usual with J.A.P. engines. As will be seen from the illustration, this innovation admits of the contact breaker being placed on the "outside" of the machine. On the engine-shaft and between the crank case and smaller chain wheel which drives to another, twice the diameter, on the armature-shalt of the magneto; thus the speed is reduced to half without the means of gearing. A single guard en-

ab'e by removing three large nuts.

A Sturmey-Archer gear box and final belt drive form the transmission. The be't wheel, which is carried on a separate

The gear box bracket, snowing how the fixing plates are fastened to the frame

journal bearing, remains undisturbed when the rear wheel is removed. journal

At every point the framework is of a most substantial character, and accessibility has not been overlooked. The sidechassis is

rectangular in shape, has a diagonal reinforcement member, and four-point attachment by means of lugs cast integral with the frame.

Mudguarding of all wheels is well carried out, and the carrier stoutly constructed and stayed to the main frame by two horizontal tubes

Both the large tank and the sidecar hody are finished in light grey, trimmed with a dark shade of the same colour, and at the rear of the sidecar there is a large locker, in the form of a "boot," to which is fixed the carrier for the spare wheel.

The equipment includes adjustable

handle-bar, Brampton Biflex forks, aluminium swing-up footplates, drip feed and auxiliary hand pump, and Amac car buretter. The price, complete with spare wheel and tyre, is £185.

PETROL CONSUMPTION.

THERE appears to be an impression among present-day motor cyclists that their petrol consumption is greater than it should be. Frequently we have heard the remark that post-war spirit does not give the same mileage as that used in 1914. For this reason the results given in the judge's report of the Liverpool M.C. Trial held last autumn

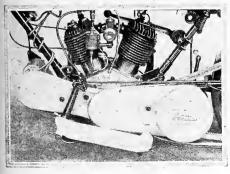

are of interest. The following are the best performances in the various classes:

Class.	No.	Rider and Machine.	Consump- tion.	M.P.G
C.C.			oz.	
350	36	A. Moses (2 A.J.S.) .	170	108.2
500	53	Capt. A. W. Brittain		
		(3½ Sunbeam)	149	123.7
750	30	W. Coffle (41 B.S.A.)	156	118
-	33	E Williams (4 A.J.S.)	160	115
1000	48	R. R. Coes (7-9 Indian)	210	87.6
750	10	V. Horsman (4 Nor- ton sc.)	220	83.6
1000	19	Imperial-Jap sc	314	53-4

The outstanding performance in petrol consumption was the excellent consumption figures shown by all riders of $3\frac{1}{2}$ h.p. Sunbeam machines. Six riders of these machines, who finished, showed an average consumption of 182 oz., which works out at 101 miles per gallon. The best performance in any class was that of No. 53—Captain A. W. Brittain, 149 oz.,

No. 35—Capitall A. W. Brittain, 148 02., equivalent to 125 m.p.g.

The consumption of lightweights and sidecar machines was disappointing. Twelve riders failed at the easy limits imposed in this test. A modern 8 h.p. sidecar machine should be capable or applied to the capable of the capable travelling forty-five miles on a gallon of petrol, and efforts should be made by manufacturers to attain this result.

The power unit of the new Acme. An unusual feature is the fitting of the magneto chain on the left side of the machine,

N.M.C.F.U. (Leeds).

A series of smoking concerts form part of the winter programme of this branch of the N.M.C.F.U.

Liverpool M.C.

The annual general meeting of the Liverpool M.C. will be held at the Compton Hotel, Church St., Liverpool, on Wednesday, the 21st inst., at 8 p.m., and this will be followed by a concert and prize distribution.

Finsbury Park C. and M.C.

The Finsbury Club recently held their ist dinner since 1913, the attendance being over sixty. One of the guests of the club was Petty Officer Thirlwall, D.S.M., who formed one of the band of pioneers who crossed the Atlantic in the airship R34.

Coventry and Warwickshire M.C.

Owing to pressure of business, Mr. M. Sampson has been compelled to resign Jampson has been compelled to resign the hon, secretaryship of the club, and the new hon, secretary is Mr. N. Ry-croft, 48, Broadway, Earlsdon, Coventry, All communications relating to the club should be addressed to Mr. Rycroft.

Carmarthen M.C. and C.C.C.

This club recently held a successful dinner at the Nelson Hotel, Carmarthen, in honour of four members of the club who had done well in the 1919 competitions. These members are: M. Davies, A.C.U. bronze medal and Liverpool M.C. silver medal; W. Edwards, B.S.A. team prize silver cup, A.C.U. silver medal, and B.S.A. Co. silver cigarette case; Capt. Lindsay, A.C.U. silver medal, Scottish Trials silver medal, and two gold medals in the Club hill-climb.

General Committee Meeting.

T is probable that the next General Committee meeting of the Auto Cycle Union on February 20th will be held at Southport instead of Manchester, as sufficient accommodation in the latter city is impossible to obtain.

Annual Dinner.

The Auto Cycle Union annual dinner will be held at the R.A.C. on the 21st rest. On the following day, the 22nd rust, a meeting of the Federation Internationale des Clubs Motorcyclists will be i.eld at the R.A.C. at 2.30 p.m. Delegutes to this important conference will be invited to the A.C.U. annual dinner, which will be a particularly brilliant and interesting affair.

Elsewhere in this issue we give a list of 1920 competitions as drawn up by the A.C.U. This gives the dates of all important competitions, both at home and abroad, which will take place in the 1920 season. This fixture list will be published

Westmorland M.C.C.

The annual dinner and prize distribution The annual dinner and prize distribution will be held at the Commercial Hotel, Kendal, on the 15th inst., at 7 p.m. Tickets (6s. 6d.) are available from Mr. W. Westwood, 9, Gilling Gate, Kendal, to whom application should be made to-day, the 8th inst.

Plymouth and District M.C.C.

The Plymouth and District M.C.C. is not neglecting the social side of club life, and is keeping the club together during and is keeping the club together during the winter months by a series of whist drives. A second highly successful whist drive was held recently at Genoni's Café, George Street, Plymouth. The secretary, Mr. L. B. Jackson, Langham House, Plymstock, will be pleased to hear from any local motor cyclist desirous of joining the club.

East Midland Clubs.

Representatives of affiliated clubs in the enlarged East Midland District will meet at the Angel Hotel, Angel Street, Sheffield, on Saturday, January 10th, at 6 p.m. Clubs not represented at the meeting held at Olympia should en-deavour to send delegates, as arrangements for the running of the three open trials allotted to the area for 1920 will be made

A New Motor Cycle Club.

A meeting will be held at the Fox and Hounds Hotel, Portsmouth Road, biton, on Wednesday, January 14th, at 8 p.m., with the idea of forming an active motor cycle club. All motor cyclists will be welcome. Dr. A. M. Low, D.Sc., has consented to accept the presidency, and Mr. F. W. Barnes is taking an official position together with several other well-known motor cyclists.

New Club at Sydenham.

A motor cycle club is proposed for Sydenham and district, and any motor cyclist in this locality, who is interested in club life, social functions, and competi-tions, should communicate with "Secretary," 7, Venner Road, Sydenham, London, S.E.

Essex M.C.

The A.G.M. of the above club will be The A.G.M. of the above club will be held in the Associates' Room at the R.A.C. at 7.30 to-night (the 8th inst.). The annual dinner has been arranged for Saturday, the 17th inst., at 6.30. All members who have served in the war, and who were unable to be present at the reunion dinner in April last, will receive an invitation, and those wishing receive an invitation, and toose wishing to attend should apply to the hon. secretary, Mr. D S. Kapadia, Algers Road, Loughton, Essex, or the captain, Mr. F. A. Applebee, 208, Great Portland Street, W.1.

Birmingham M.C.C.

The annual dinner of the Birmingham M.C.C. is fixed for January 24th, 1920, at the Queen's Hotel, Birmingham. As this is the first annual dinner to be held since 1913, it will be in every way a re-union, and a large demand for tickets is anticipated. The presentation of trophies and prizes will take place afterwards, and as there are over one hundred pected to be present, the function should be a great success.

A musical programme has also been arranged. Tickets, gramme has also been arranged. Theets, price 15s., may be obtained from the hon. secretary, Mr. W. H. Egginton, 76, Earsbury Gardens, Birchfield, Birmingham. The annual general meeting is to be held on February 9th.

AUTO CYCLE UNION NOTES.

in the form of a folder, inside the cover of which will appear the names and addresses of the principal motor cycle organisations throughout the world, and a complete list of all the trials and competitions to be held during the coming year, while the remaining part of the inside cover will be devoted to a list of clubs affiliated to the A.C.U., and the names and addresses of their secretaries. - This fixture list will be sent to any applicant for an A.C.U. competition licence, and will be supplied to the general public for the sum of 6d.

Short Distance Records.

The Competitions Committee of the A.C.U. has recently drawn up regulations which it has recommended to be passed by the General Committee, dealing with short-distance records. These regulations state that, in addition to the flying kilometre and flying mile records, and standing kilometre and standing mile records, mean speed records for these two distances will also be made, which will be run both

ways. The following definitions have therefore been decided upon: A maximum speed record is defined as the least time on record taken to traverse a specified distance; a mean speed record is defined as the least mean time on record of the two times taken to traverse the specified distance, one in each direction of the same course. A claim for a mean speed record will not be recognised unless the attempt thereto has been made within a period of two minutes calculated from finish to start.

Paris-Nice Trial.

The A.C.U. is prepared to undertake the insurance of competitors who will take part in this event, and will offer the advantages of the R.A.C. Touring Department to those of its members taking part in the trial, as regards transport to Paris of themselves and their reaching and all familities whiting the machines, and all formalities relating to the international driving passes, Customs, and passports. Entries close January 15th at ordinary fees.

INGENIOUS LUBRICATOR FOR DISC WHEELS.

A N ingenious lubricator, specially designed to lit on to motor cycles equipped with disc wheels, has lately been brought out and provisionally

disc wheels. and quite practical.

An oil-tight packing is placed beneath
the clip, so that all oil injected through
the lubricator is bound to reach the
bearings.

well thought out,

A NEAT ELECTRIC SIDECAR LAMP.

A N attractive sidecar lamp is sold by Messrs. Godfreys, Ltd., 208, Great Portland Street, London, W.1. The frm of lamp illustrated is not uncommon.

We are already rsing one on a sidecar, but it is fitted with a small gas burner. It is exceedingly nent, and admirfulfils the ably purpose for which it is intended. namely, to give a tiny light showthe sidecar. This lamp, as the illustration shows. has been adapted to take an electrie bulb, which it is able to do in a

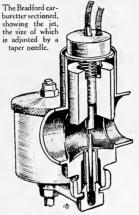

very efficient manner. Either end of the lamp may be unscrewed, so that it is quite a simple matter to replace the bulb should occasion arise.

A TWO LEVER CAR-BURETTER.

THE usual tendency in carburetter design is at present in the direction of single lever control, but many designers are of opinion that a second lever is essential in a country like our own to correct the changes of altitude and weather conditions. Among these is Mr. J. T. Bradford, Coine, Lancashire, who has produced the carburetter illustrated herewith. The main throttle lever

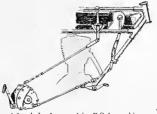

controls both the mixture supplied to the engine and the air, the second lever raises or lowers a tapered needle which enters the jet and varies its size as required. This needle does not rise and

fall with the throttle as in some carburetters, but is entirely independent of it, and regulates the quantity of fuel that may be required for varying conditions. More than this, it can be closed entirely when pure air may be drawn into the engine through the open throttle for cooling purposes when descending a hill. We are informed that very satisfactory results, including a consumption of 140 m.p.g., have been obtained from this instrument.

A HAND CONTROL FOR THE B.S.A. CLUTCH.

A SIMPLE attachment has been brought out by the County Cycle and Notor Co., 307. Broad Street, Birmingham, which will be much appreciated by riders of B.S.A. motor bicycles, enabling them, if they desire, to adapt their clutch to hand as well as foot control.

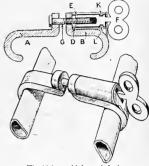

A hand clutch control for B.S.A. machines.

The device consists of a clip to fit round the down tube of the motor bicycle, a cranked handle, so as to bring the lever within access of the left hand, and a connection from a short lever on the end of the handle spindle to the clutch pedal arm, as illustrated.

A MOTOR CYCLE LOCK.

A N ingenious motor cycle lock has been recently provisionally protected by Mr. A. B. P. Hobson, 20, Oxford Southampton. It consists of a fork made in two sections, operated by a special key, and designed to clip tightly round

The Hobson thief-proof device.

the forks and between the spokes of a motor cycle. When once in position it cannot be removed, except by the aid of the special key.

The two sections of the fork are drawn together by means of a circular nmt D threaded on to the central bolt G, one end of which is rigidly fastened to the hook A. In the outer face of the circular nut there are recesses E to take the prongs of the special key F. Wards K and L may be fitted inside the tube through which the key passes, so that the key will fit only its own particular lock.

CLEARING A CLOGGED BURNER.

The Editor does not hold himself responsible for the opinions of his correspondents. All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

AN IMPROVEMENT IN AIR-COOLING.

Sir,-I was very much interested in your description of Mr. Morgan's device for air-cooling a motor cycle engine-by means of the ejector action of the exhaust (à la "Lewis -

I have protected such a device used in conjunction with

one or both of two other methods.

Mr. Morgan will find that, except for very "light running," such cooling is not sufficient, as will be shown by considerations of the induced vacuum obtained by even excessive throttling of the exhaust, of the velocity, volume, and range of temperature of the air current involved, and of the B.T.U.'s to be transferred from the cylinder walls to keep their temperature within reasonable limits.

LINDON PEARSON (CAPT.).

MOTOR CYCLE SPEEDS.

Sir, In your "Letters to the Editor" column of *The Motor Cycle*, dated 2nd October, re motor cycling speeds, we notice a New Zealand correspondent states "a machine has been timed to do over 100 miles per hour."

May we point out that the world's speed record is held by the Indian motor cycle, when Mr. Jack Booth, at Adelaide, Australia, covered one mile, flying start, in 35 seconds, equalling 102.8 miles per hour.

equalling 102.8 miles per hour.

The South African speed record also stands to the credit of the Indian. On the 16th December, 1918, at Pietermaritzberg, Natal, South Africa, Mr. Pete Lawrence, on the road (not a prepared track), raised the previous record of 33½ miles per hour to 90 miles per hour, and until Mr. Booth made his sensational record, Mr. Lawrence's time was the fastest in the Southern Hemisphere.

Johannesburg. WILLIAMS, HUNT & CO.

LESIGN OF THE METRIC ENGINE.

Sir,-I notice in "Ixion's" comments a note connecting me with the Metric engines which aroused so much interest

May I trespass on your space to explain my position in this matter; as I find there is considerable misapprehension

on this subject.

The responsibility for the design of the Metric engines belongs to Mr. Bacher, and to him alone, and no share of the praise therefore is mine. My connection with them was in the production of the two models which were in

exhibition, and arose as follows:

On November 10th, Mr. Bacher gave the order for these two engines, to be constructed in time for the Show, to Leopold Ward, the firm of experimental engineers with whom I am now associated, and the carrying out of the work in the stipulated time has been my share in the production of the exhibit on which "Ixion" comments.

The engines were, in point of fact, delivered by 9.30 a.m.

on November 24th.

I quite agree with "Ixion" that the engines should have been inside and not in the Hammersmith Road, but, unfortunately, the Exhibition Committee were unable to allot us any space.

Leopold Ward was also responsible for the manufacture of the oscillating spherical valve which was on view on the Coulson B. stand (Messrs, F. Aslett Coulson being sole concessionnaires for motor cycle engines with this valve), and on which we are still carrying out extensive bench and road tests with a view to perfecting it before putting it on the market, instead of afterwards, as is sometimes the case. I also note "Ixion's" remark on a flat twin with cylin-

ders and crank case in two parts. I should very much like

to show him a flat twin air compressor, in which the two cylinders and crank case are in one casting, and that of aluminium alloy.

We do not at the moment see how we can reduce the weight or add to the simplicity of this design.

P. BREWSTER.

WATERPROOF CAPS.

Sir, Mr. Leather is, I am sure, quite near the right thing in his letter referring to the need expressed by "Ixion," for a waterproof headgear for motor cyclists.

He recommends a dome-shaped crown with a flexible rim. It is well known that the despatch riders at the front found the "tin hat" right in every respect except that of weight. It kept the rain and mud off the face and out of the neck.

A dome-shaped crown and stout flexible rim made of first quality felt would serve the same purpose; it would be quanty feit would serve the same purpose; it would be necessary to ventilate it well with armoured eyelet holes on each side. A chin strap might he added. Your readers may think that such a hat would blow off. I can assure them that in actual practice it does not.

I am a clergyman, and I always ride with a hat of clerical Rain a deligyman, and I always now while a lat of the trans-shape—domed crown, flexible rim, good felt, no chin strap. Rain never yet penetrated good felt. I ride a 3½ h.p. two-stroke, which doubles the speed limit at a bound. I ride over hills and moors in all weathers, often in fifty knot gales, yet I have still to stop my machine for the first time to recover my hat. The first hatter who makes a good felt hat to Tommy's "tin hat" pattern shall have my custom. CLERICUS.

Paisley.

SHAFT DRIVE.

Sir,—Please allow me to express my interest in "FN 240's" letter on "Shaft Drive" in the issue of November 1240's 20th.

It seems strange that no English firm has yet adopted this, as it appears to me an ideal form of transmission for

motor-cycles

Perhaps "FN 1240" will let us know what mileage can be accomplished before wear and tear takes place in the drive, if wear can be taken up, or if the worn parts are easily renewable; what milcage per gallon can be done on the F.N. solo, and ditto with sidecar? All pertinent queries, as one never sees or hears of the machine in competitions or trials. Amply mudguarded and the drive enclosed, as I believe the latter is, the F.N. ought to be ideal. Is it?

A. A. SMITH.

Sir,-I am glad to see "FN 1240" taking up the question of shaft drive, and I heartily endose his statement that it is the drive to give unqualined satisfaction in many thousands of miles of sidecaring. The reasons for this satisfaction are: (1) Absolutely positive. (2.) No adjustment. (3.) Very little wear. (4.) Perfectly smooth. There can be no slip, even in the wettest weather, and freedom from adjustment is a great been expecially with a sideor. ment is a great boon, especially with a sidecar.

It can also be added that this transmission does not in

any way hinder the removal of the rear wheel. I recently inspected the bevel gear of a 1912 F.N., and can find no trace of wear on either pinion.

Why do manufacturers not consider the shaft more? It

is certainly worth considering at least. In conclusion, may I state that my "ideal" sidecar machine would be a four-cylinder with shaft drive, and the nearest approach we have to it to-day is the F.N.

A. F. BURNS.

A.C.U. SIX DAYS TRIALS.

Sir,—I am much indebted to the Scott Motor Cycle Co., Ltd., for pointing out the error in the average marks awarded to Scott machines in the late A.C.U. Six Days Trial.

The report that I based the averages on was the provisional results published in *The Motor Cycle* of September

What I wish to point out is, that at the time of writing I had no other material available except the provisional results, and my purpose in writing was to draw the attention of the average motor cyclist to the average performances of the machines entered for the Trial. Immediately after the provisional results were published, makers displayed large advertisements telling of gold and silver medals obtained, but, of course, omitting all mention of medals lost through machines retiring!

I have rewritten the class in which the Scott machines

figure, as follows:

,	Make	Number of Machines 10 Start.	Total Marks Divided by Number of Machines	Position of Merit.
	Royer	1	189	r
	A.J.S	1	188	2
	Scott	5	182	3
	B.S.A	5	180	4
	Norton	2	-/ 170	5
	Triumph	4	165	6
	Zenith	4	132	7
		'	>=	,

I shall be much obliged if you will insert this letter, as I have no intention of misrepresenting the performances of any firm's productions.

STANLEY WELLS.

THE A.C.U. REPORT.

Sir,—In your issue of December 18th I noticed a letter signed "Lightweight" in reply to Mr. Norton's criticism of A.C.U. report. Whilst I am sure that Mr. Norton requires no assistance in dealing with this letter, I cannot let some of the statements made pass without comment. It is fairly evident from some of "Lightweight's" remarks that his experience does not include the use of the type of machine which he condemns. It is a pity that some of your correspondents cannot take a wider view of the matters they criticise, and realise that there are different types of riders to whom different types of machines appeal.

With reference to his remarks on the superiority of water-

With reference to his remarks on the superiority of watercooling being proved by the results obtained from the Scott motor cycle and the Lanchester and Rolls-Royce motor cars —without wishing in any way to detract from the excellence of these products, I should like to point out that, so far as

motor cycles are concerned at any rate, equally as good results are obtainable from air-cooled engines.

I think that no manufacturer would question the statement that such machines as the Norton, A.J.S., Triumph, and numerous others are capable of putting up performances in every way equal to the best which can be done with the water-cooled engines. I would point out that a number of motor cycle manufacturers have utilised the water-cooled engines and abandoned them, amongst them being such firms as Messrs. Humber and F. E. Baker. Aircraft work has proved that the air-cooled engine is capable of as high efficiency as the water-cooled type, that air-cooled cylinders up to 50 h.p. can be used without causing heating troubles to arise, and in view of these facts several motor car manufacturers are experimenting with, and some have even adopted, air-cooled engines for car work.

Few motor cyclists wish to be bothered with a water tank in addition to their petrol and oil tanks, with the trouble of constant replenishment and the necessity for draining them off in frosty weather. The question of adding unnecessary weight is also a serious one. Nor can it be claimed that radiators are universally satisfactory. A high proportion of these fittings become leaky after a few years' use, even on high-class motor cars, where they have all the advantages of occupying well sprung positious. This fault is very much aggravated on motor cycles, where keeping down the weight and the fact of their being in a comparatively unsprung position canse this trouble to arise at a much earlier period.

With regard to motor car and motor cycle transmission. A single gear belt-driven machine is a perfectly satisfactory

mount for thousands of riders who do not wish to participate in A.C.U. trials, and thereby meet conditions of road surface and gradient which never occur in their ordinary riding. Furthermore, many of these very rarely have occasion to use their machines in heavy traffic, and consequently a single gear machine fully satisfies their needs. It is cheaper to buy and to maintain than the more complicated mount. It is lighter, and, generally speaking, under ordinary riding conditions on the open road a more usable vehicle. These remarks on transmission should not be interpreted as applying to sidecar outfits, where it is acknowledged that some form of clutch and variable gear is necessary.

form of clutch and variable gear is necessary.

The relative efficiency of motor cycle and motor car transmission undoubtedly shows largely in favour of the simple motor cycle. Few cars could claim an overall transmission efficiency of 75% in all running conditions, while the direct belt-driven motor cycle can claim a permanent efficiency of over 93%, with a corresponding saving in petrol and oil

consumption.

In conclusion, I should like to say that I consider the A.C.U. Trials have been a very great benefit to the industry, and have developed the motor cycle along useful lines, but of late the improvements in machines have made the Six Days Trials too short to test out the soundness and durability of our monts; the consequence has been that in order to test the machines, conditions of riding have been sought which practically never occur in the normal use of the machines.

I quite realise that there are riders for which the A.C.U. type of machine is a most suitable mount, but although "Lightweight" is evidently one of this class he must realise that that type of machine by no means suits the whole of the riding public. Different users operate their machines in widely different conditions, and what suits one man is totally unsuited to another. There is ample room for all types.

KENNETH A. HELLON.

Midway up Hard Knott Pass. Just below this point is the steepest gradient—I in $2\frac{\pi}{3}$ for a few yards. (See page 30.)

LOST TOOLKIT.

Sir,-On Thursday, December 4th, a kit of tools was picked up scattered along the road near Gravesend. If the owner is fortunate enough to be a reader of your excellent paper, I thought, perhaps, if I informed you, and you published this letter, it would be the quickest way of restor-

I would be pleased to forward them to the owner upon his giving a description of the tools.

J.E.H.

CROSSING DARTMOOR IN THE SNOW.

Sir,-I am enclosing a photograph, taken in the snow, on Dartmoor, near Princetown The machine is a 1919 Lea-Francis, belonging to myself, and the person sitting on the ground is my sister, who was riding a Levis, until the belt

On Dartmoor. (See letter from Mr. I. D. Spooner.)

broke, necessitating her leaving the machine behind, and her riding the rest of the way on my Tan-Sad carrier. The snow in some places was 11th. deep.

IAN. D. SPOONER.

THE LIGHTING REGULATIONS.

Sir,-Having read your correspondents' voluminous remarks on the subject of rear lights, I am driven to a frenzy of despair, from which I can only find relief by submitting to you the following epitaph, which I can but hope will toll the knell of the bitter passions that have been aroused over this vexed question:

Here lies a pedal cyclist, dead Because of his unmanly dread Of carrying a rear light red. Had he not "Sivel's" letters read He might have lived to die in bed -Nuff said!

Bridgwater.

SHAKESWORTH.

Sir,—May I ask for a little space to reply to the attack made on me by "Sivel." This correspondence seems to be wandering a little from its subject, and it might be headed "Logic" or "Split Infinitives." Still, it adds to the gaiety of nations.

of nations.

First, I challenge "Sivel" to point out a single illogical sentence in my letter. No one, I suppose, thinks that "Sivel" seriously means that brickbats, etc., should carry red lights, and I, for one, have never accused him of it. Still, he says: "What form of danger signal do the enthuliation of the control of these impedimenta?" I siasts of the rear light propose for these impedimenta?" I took this for an example of the cheap rhetoric of which he accuses "Iorwarth." The inference contained in his letter is that, because these impedimenta cannot carry red lights, cyclists should also be exempt. A misquotation is certainly a misquotation; no one has denied that very obvious fact, but to call a misquotation of words only, where the sense is in no way changed, a deliberate misquotation is a departure from fairness and truth of which I, personally, should be ashamed. The opponents of red lights argue that, because accidents have happened where red lights are used, these are entirely useless; this is illogical and absurd. Wrecks have taken place in the neighbourhood of lighthouses, but will anyone deny the use of the latter? Even if fifty accidents could be proved to have taken place in

spite of red lights, I should still maintain that hundreds had been prevented by their use. "Sivel's" summing up of his opponents' argument is, too, entirely illogical and incorrect. No such statement has been made, and so far as I know no one holds such views.

Regarding a statement made in my last letter and doubted by "Sivel," I assert positively that I have seen white lights shown to the rear of cycles scores of times; the red light in front is less common, but I have met with it more than once, and only a week or so ago a cyclist was fined for this

wery offence.

"Sivel" accuses me of being guilty of a split infinitive, which apparently he thinks is to be found in the following sentence. "How does he know that his escapes have not been entirely due to the presence of his light?" This sentence of the sentence of th tence does not contain an infinitive. Can one split what is not there? A schoolboy once said "a preposition is a word you must never end a sentence with." This is sound, though badly expressed, and those who read "Sivel's" recond letter will see its point. These are small points, but I fear that "Sivel's" knowledge of the English language is about on a par with his acquaintance with logic.

The last sentence of "Sivel's" letter is merely rude, but

no matter! I used his own phrase with intent, as he should have seen. I thank him for his new phrase, but, as the inconvenience is not serious, the real benefit not lacking, nor the cause lost, I fear I shall have no use for it, though it would be excellent if properly applied.

JOHN HOLLAND.

2/- 2/3

Sir,—I wish to state my views in opposition to "Sivel's" letters I read in The Motor Cycle.

I can with difficulty believe that the motor cyclist who has had a "protracted experience of the delight thereof" can be in earnest over most of the silly statements he made

in his letters.

He says: "To say that a cyclist must carry such light in order that his presence may be thereby known to the motorist is certainly one of the most absurd grounds that could possibly be put forward." I would like to ask him why it is absurd. For what other reason were rear lights for bicycles ever manufactured but to let other users of the road, especially motorists, know of the presence of a bicycle? It is obvious that it is much more essential that the slow-going push bicycle should have a rear light than the motor cycle or any other meter vehicle.

Your correspondent enumerated a list of things that a motorist may meet on the road at night. Pedestrians, of course, should walk as close to the side as possible if there is no footpath. In the country a motorist sometimes meets cattle and stray horses on the road at night, but it is unavoidable, and the motorist has to take the risk of a collision; but I would like to know the number of motorists who have had accidents at night due to broken-down carts and parcels dropped on the road. Your correspondent then asks, "What form of danger signal do the enthusiasts of the rear light propose for these impedimenta?" We "enthusiasts" (of whom I am one) are not such fools as to expect stray cattle or parcels dropped on the road to carry a rear light or any other warning device. Your correspondent argues on these lines: "Because a ship at sea is lost due to a collision with a floating mine, why should ships carry lights? Why should there be lighthouses?"

BOOKS AND MAPS FOR MOTOR CYCLISTS.

Issued in conjunction with The Motor Cycle.

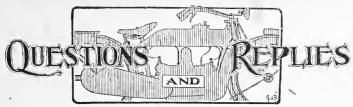

HINTS AND TIPS FOR MOTOR CYCLISTS." Price By Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Sixth Edition. (Second Reprint.) 2/- 2/- 2/net, post.

"THE MOTOR CYCLE" ROAD MAPS.
England and Wales, Scotland, London (showing roads into and out of London and avoiding London),
Mounted on linen. Set of three, complete in case

Obtainable by post (remittance with order) from ILIFFE & SONSLtd., 20, Tudog Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for retly. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and being a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Correct Level for Benzole.

What difference in the level of the spirit should there be in a 26 jet when using benzole instead of petrol?-H.S.

It may not be necessary to alter the level when using benzole, although it usually is possible to lower it about onesixteenth of an inch.

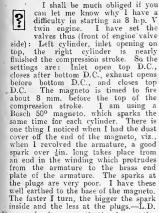

Sidecar on Lightweight. According to the makers of a

certain 23 h.p. two-stroke motor cycle, their machine will take a sidecar. Could you tell me if the frame usually fitted to this class of machine would stand the strain; also, if the engine would be sufficient? Would it be reliable? What, with reasonable care, should be the average life?-Novice.

We do not recommend the attachment of sidecars to extremely light machines, although in an absolutely flat district such a fitting might be moderately suc-cessful if a two-speed gear were used. The machine should be reasonably reli-able, and any modern motor cycle, with certain occasional renewals, should have an almost indefinite life.

A Magneto Defect.

Your engine is apparently timed correctly, both as regards valves and ignition. It

in the magneto. Possibly the high-tension wires are broken internally, or maybe the carbons in the high-tension brush

holders are not free in their guides. If attention to these points does not reveal the defect, we should recommend that you submit the magneto to an expert repairer.

Dynamo Details.

I have been a keen reader of your most valuable journal for several years, and am now writing to ask your help on one a small 12 volt 250 watt dynamo for lighting and charging. (1.) The dynamo, 1 notice, has three leads, marked red, yellow, and black respectively. What is the purpose of the yellow lead, and what must be done with it? (2.) Does it harm the dynamo to run (a) with all switches open, (b) while dead shorting the leads? (3.) What size fuse wire shall I need to use? (4.) I propose using an iron wire resistance when charging. What number L.W.G. will be necessary? (5.) Should the ammeter reading be the same when the accumu-

lators are being charged when wired in

parallel and in series?—E.H.B.

(1) One of the three leads will be smaller than the other two. This one is the shunt field lead, and is brought out for the purpose of introducing a shunt field regulating resistance on the switchboard, if necessary. By this means you can obtain additional voltage regulation in an economical manner. You can, however, if you prefer, connect the shunt lead directly to the opposite brush to which the other end of the shunt winding is permanently connected. (2.) It does no

harm to run with all switches open, but on no account run with the armature short circuited; it would burn out at once. (3.) Ask for twenty ampère fuse wire. (4.) To carry the maximum current which this dynamo will give without becoming unduly hot will require a fairly large iron wire, say, No. 12 B.W.G. wound on a bar in diameter. This will give you about one ohm per 790 turns. It is not possible to give you exact figures, as the composition of what is commercially called "iron" varies so greatly, but the above amount is approximately correct. (5.) If you have two when they are put in parrallel the ammeter will read double the amount shown when they are in series.

Bent Rear Forks.

I shall be glad if you can give some advice on the following point concerning a 4 h.p. Triumph motor cycle which I have recently purchased. The previous owner, in putting it up on its stand, let the machine down so heavily that the forks running from the engine to the hub of the back wheel are bent. If I have these straightened, will the machine be safe to ride, or would you

recommend having those forks entirely

In all probability it would be better to have new tubes brazed into the rear forks of the machine, although if they are not badly bent they could be quite easily straightened if warmed by a brazing lamp.

replaced ?-W.A.B.

The public displayed great interest in the London-Exeter run, its as they hid in an the important trials of 1919. The scene depicted shows a rider of a flat twin Harley-Davidson at Salisbu v

Faulty Running Two-stroke.

I have a 2½ h.p. 1919 model two-stroke that ran well until quite recently, when it started to choke. I have changed jets, and tried every possible variation of mixture, and cannot get it right. Compression is good, and I use No. 1 spirit. Speed is very poor, and as soon as I open out it chokes and splutters.—N.B

It would appear that the trouble with your two-stroke engine is due to the sparking plug having become defective. We should recommend you to experiment with a good quality detachable plug, baving fairly substantial electrodes, also make certain that the timing has not slipped. Note particularly if the nut on the magneto sprocket is tight, and also verify the fact that the spark occurs on top dead centre when the ignition control is fully retarded.

An Electric Lighting Scheme.

I have a Rover, with three-speed hub. I have fitted T.T. haudle-bars, and wish to fit a second pair of footrests beneath the saddle, im place of the present pedals. I shall therefore remove the pedalling chain. I have a Brooks motor cycle carrier attaché case on my carrier, and propose fitting a dynamo and accumulator in this, and running the dynamo off the old kick-starter chain sprocket Please let me know if you consider the idea feasible.—
N.L.W.

We do not think that your proposed fitting is practicable. The sprocket on the three-speed hub is a free-wheel, and consequently would not drive the dynamo unless it was locked in some way. The speed also would be too low. If you desire to fit electric lighting to your machine, we should advise you to have one of the lighting dynamos specially made for the purpose.

Timing for Speed. .

(1.) Is it possible to alter the makers' valve timing of my 1919
4 h.p. countershaft Triumph for speed work? (2.) If not, would the timing gear as fitted to T.T. Triumphs fit my machine, presuming that a special timing gear is fitted to T.T. Triumphs? (3.) The lead in millimetres to give the piston before top dead centre with the ignition lever fully advanced and points just breaking, for normal running and for speed work (4.) Most suitable size jet for speed work irrespective of petrol consumption.—F.M.

(1.) You cannot improve on the makers' timing of the 1919 Triumph engine, nor can you alter it largely unless you have a new timing wheel and cams, and this would have to be specially made. (2.) We do not know of any variation in the cams fitted to the T.T. and the ordinary models, but would recommend you to write to the makers for information. (3.) Normal lead 10 mm. for speed 11 or 12. (4.) The most suitable jet size can hest be found by experiment. If you think it necessary to vary the jet in your carburetter, the best course is to procure a selection of jets from the makers.

READERS' REPLIES.

Risk of Fire.

In reply to "Rudge Multist" (page 763, December 11th), I may say that the Minimax Co. in 1912 made a special fire extinguisher with bracket which could be fitted to any motor cycle. They have agents in almost every town in the British Isles.—WRINKLE.

Misfiring on One Cylinder.

"J.W.S." should examine the inlet valve of the offending cylinder, and find out if the stem is not unduly worn. I have no doubt that this is where his trouble lies. His query appears on page 765, issue dated December 11th.—GULLANITE.

Belt Trouble.

Having read in your issue for December Having read in your issue for December 18th a letter from a correspondent, "W.H.," bewailing the use of four belts in 5,750 miles on a Rudge-Multi, and asking advice, I tender the following experience for what it is worth: His figures are ridiculous if the gear is used with receptable ears and he gets hold of with reasonable care and he gets hold of good belts in the first place. For my part, I always use Dunlops, and have on my present Rudge a belt which has done hy bresent mage a bett which has done day, but he shortened it twice only, and it should be good for two or three thousand more, judging by appearances. Of this distance, which has included many rough roads. hills and much traffic riding necessitating constant use of the gear lever, I estimate that 75% to 80% was done with a pillion passenger. On a 1913 model Rudge-Multi I owned I could rarely get more than 2,500 to 3,000 miles per belt; but, even so, that was no extravagance, as the saving in tyres, petrol, and oil from the careful use of the gear much more than paid for the belts. The points to notice are: (1.) To keep the belt adjusted nicely, which is the simplest of matters with the rear hub tensioning device now fitted. Allow for 2in. play up and down, i.e., gripping centre of belt between pulleys, adjust so that it may be raised lin. and depressed lin. from its normal straight line. (2.) Move the gear lever gradually from notch to notch. (3.) Change down the whole time just before the engine lags. This saves the belt, the tyres, and the engine. So many riders of a Rudge-Multi think that the essence of driving is to hang on to a high gear to the last moment possible, regardless of the violent snatch that may be caused. They forget that the average 3½ h.p. engine is geared 5 to 1, or at most perhaps 4½ to 1, and, owing to the splendid hanging-on powers of the Rudge engine, they overlook the fact that they may be using a gear of 31 to 1 at 10 or 12 m.p.h., and if they should be carrying a passenger the strain and jar then are very great. I should be quite willing to wager that is the cause of "W.H." hreaking his spokes. Might I suggest to "W.H." that he reckon-out about where his lever should be at a gear about where his lever should be at a gear of, say, 5 to 1, and not use a higher gear than that at speeds below 20 m.p.h. A gear of 4 to 1 seems to suit the Rudge engine very well at 30 m.p.h., and the last two or three notches come in very nicely over that speed. If he will adhere to a rule on those lines I do not think "W.11." will be troubled with more broken spokes or vnewed up belts. And

possibly these tips may be of use and interest to other riders of Rudge-Multis whom I daily see using their gear in such a way as to ask for trouble of a similar nature to "W.H.," but to a more prononneed degree. Unfortunately, a very plucky little eugine makes the multi-gear rather a danger in the hands of people who do not understand that the underlying principle of driving a motor cycle is, or should be, to keep the engine to a fairly good and even number of revolutions. I should like to finish up with an appreciation of the Rudge as the ideal solo mount—engine, gear, foot-oiling system, spring-up stand, and many other details, including the steering. Should "W.H." care to communicate with me directly I will try to answer any points of difficulty he may have.—Rudge-Multi (Rediord).

Referring to "W.H.'s" query on page 791 of your issue of December 18th, I experienced the same trouble on my 34 h.p. Rudge-Multi. I think if he will fit a John Bull žin. belt on his bicycle and never move his gear up or down more than two notches at a time, he will do away with his belt trouble, and the breaking of spokes as well. I find that a John Bull belt wears very well on the Multi. I can get six to eight months' wear out of one, using the cycle every day.—N.J.S.

EXPERIENCES WANTED.

"H.D.L."—Most suitable lightweight for use in Central Africa.

"I.J." (Chelsea).—Steel and rubber studded tyres. Efficiency on greasy surfaces.

RECOMMENDED ROUTES.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.
ADVERTISEMENTS in these columns First 12 words 2 6, and 2d, for every additional word. Paragraphs of under 8 words are chargel double ra e, i.e., 5/-. Each paragraph is charged separately. Name and aldress must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertise ments should be made, payable___ to ILIFFE & SON3 Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances,

All a iveruse nents in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning pravious to the day of issue.

All letters relating to advertisements should quite the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken 12 to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be taken addressed to numbers at "The Motor Cycle". Office, 12 When this is desired, the sum of 6d, to defray the cost of 17 registration and to cover postage on replies must be added 12 to the advertisement charge, which must include the two the advertisement charge, which must include the words Box one, c/o. "The Motor Cycle," Only tone number will appear in the advertisement. All replies should be all lessed No. 0.00, c/o "Motor Cycle," 20, Tudor Street, 12 E.C.4. Replies 10 Box Number advertisements containing 12 renitances should be sent by registered post, but in all such 12 cases it is advisable to make use of the Deposit System.

Leades us advisable to make use of the Deposit System. In the case of motor cycles offered for sale nafer a box namber, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine oldered may be seen and fried.

DEPOSIT SYSTEM.

DEPOSIT SYSTEM.

Persons who besine to seed money to unknown persons my deal in perfect safety by mailing themselves of our Diposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt. The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays circiage one way. Por all transactions up to fig. a diposit fee of 1/1 is charged; on transactions over fig. and and and more foot. The seller but, if not we return the amount of the seller but, if not we return the seller but, if not a seller but, if the se

SPECIAL NOTE.

Realers who reply to advertisements and receive no answer to their enquiries are requested to recard the answer to thair enginees are requested to recard the silence as an indication that the goods advertised that alreat/ been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to sach one by post.

BOOT REPAIRING.

"Elite Rivetless Soles."

Soles STUCK ON-NO TOOLS REQUIRED.

These Soles are specially prepared with an adhesive surface and fixed with Eilte Sol-fax Solution. WE GUARANTEE THEM TO HOLD AS FIRM AS RIVETS OR SEWING. The process of fixing is exactly the same as that of repairing a punctured is exactly the same as that of repairing a punctured Motor or Motor Cycle Tube. One of the many great advantages of our process is that no damage what-ever is done to the Boots or Shoes which, when fitted with our Soles become ABSOLUTELY WATER-PROOF. Full instructions given with pair of Soles.

The Simple Motor Cycle.

EARLY every motor cyclist has his own requirements, which may differ widely from those of his neighbour. course, accounts for the many types which successfully find a market. There are those who require a heavy sidecar machine capable of carrying a luxuriously appointed attachment over the roughest and hilliest country. Some only demand a lighter mount capable of occasional sidecar work on reasonable roads, and to many the sidecar is altogether unnecessary. What of the solo rider? He has a choice between the 8 h.p. variable geared mount and the 11/2 h.p. scooter.

The popularity of the little two-stroke is such that one can be assured that there is an enormous market for a machine which can go anywhere over ordinary roads and climb with ease any The two-stroke is admirable main road hill. for those who are content with moderate speed, but there is a large class of sporting riders who demand a fair turn of speed and a light machine at a moderate price. These are the enthusiasts who ride single-geared T.T. machines—a class of vehicle which is in danger of being ousted from the market by the demands of those who need sidecars.

There are very few makers left to us who market a T.T. 31/2 h.p. which has not been spoiled for its original purpose by increased weight and unnecessary fittings; yet our daily letters show that the class to whom this type of mount appeals is still of considerable proportions. A good 31/2 h.p. single with direct drive is lighter, cheaper, and simpler to keep in order than a dual purpose mount, and will go anywhere that 90% of present-day motor cyclists require, if the rider is agile and not averse to slight inconvenience on occasion. A really first-class clutch is an advantage in traffic. The saving of £20 to £30 in price and 50 lb. weight, in addition to the lessened cost of upkeep, must appeal to a large number of riders.

The decision of the A.C.U. to retain the 500 c.c. class for the Senior T.T. race in June may, however, stimulate interest in this type of machine.

Effects of the Moulders' Strike.

S the weeks pass and no signs of a settlement of the moulders' strike appear, the thinking motor cyclist must by now have realised some of the possible effects these labour troubles may have upon the production of motor cycles. Practically every manufacturer is now at' a standstill with stocks of raw materials depleted and delivery of new machines is delayed. Even if the men resume work immediately, considerable damage has already been done, and ill-effects are bound to be felt by both maker and user throughout the year, and every day production is held up increases these difficulties. It is a deplorable state of affairs, and it is questionable whether anyone will benefit by it. There is something wrong with affairs in general when a very small section of the community can jeopardise the foundations of industry.

Unless a speedy settlement is made, the nation will suffer harm from which it will take years to recover, for at the present time especially, export trade is the very lifeblood of the country, and this is being held up. So far as motor cyclists are concerned, the effects of the strike undoubtedly will be many. Promises of delivery made a few months ago cannot be fulfilled; outputs will be smaller; prices higher, because the overhead charges of the year will have to be apportioned to fewer machines. Second-hand prices are also bound to be higher, because of the scarcity of new mounts. Experimental work is held up. The T.T. race is in danger, for, unless manufacturers are able to commence their new racing machines in good time, it will be futile to enter.

It is time the public realised that this paralysing strike affects them personally as well as the country in general.

A Tip for the Next London-Exeter.

ERE is a tip for the next London-Exeter. If there are any gas lamps left on the road by that time, the only absolute insurance against trouble is to use dissolved acetylene. It eliminates generator and burner troubles at one swoop, and the man who cannot fake up pipe connections to last over one night is unfit for competition work. In sober fact, this system is actually preferable to electricity for competition work, for if it is less convenient, it is necessarily more reliable. I have used it for ten years, and have never had any stoppages with it, barring perished tubing. On the other hand, I have had a score of stops with electric lamps during 1919. Most of them were trivial-a blown fuse, a dud filament, and the like. Give me electricity for daily use, because of its convenience. Give me dissolved acetylene for "twenty-fours," because it cannot shortcircuit or do in a bearing. I use the handy cylinders, even for solo competition work, for one six-foot cylinder will last a head and tail lamp for fifteen hours with ease; but it is, of course, found at its acme of mental comfort on a sidecar, which can easily stack a reserve cylinder.

Back to Plain Bearings?

READ "Ubique's" brilliant article on mechanical progress in our issue of January 1st with great interest. One of its by-products, in my mind, was a reflection that we are all faddists, and that design is an extremely contentious affair at the best. For example, "Ubique" hates mechanical noise as much as I do. He has an equal detestation (which I unblushingly refuse to share) for exhaust noise. His ideal motor bicycle is as silent as the breathing of Venus. In his enthusiasm he desires to enclose the tappets and valve stems, à la Corona, and to eliminate the rumblesome ball and roller bearings now so fashionable. I, on the contrary, desire overhead valves, and that on an engine of the so hotstuff typethat its exhaust valve spring and stem will need direct cooling: I admit I do not love the subterranean burr which a multitude of ball or roller bearings confer on an engine. But these bearings have produced the only motor cycle engines I know which have printable lubrication consumptions; and I do not want to go back to the old days of over-oiling and lightning carbonisation. It is only fair to add that "Ubique" pleads for a combination of forced lubrication and plain bearings, from which he doubtless expects maximum bearing life and minimum oil consumption. M'yes! I have only tried out one engine on those lines, and it was not a hotstuffer. But somehow it was nothing to write home about either in economy or durability. I suppose I cannot have it both ways. If

naked valve gear and non-plain bearings spe mechanical noise, well, I shall have a fresh argumer in favour of my heresy that soupcon of exhaust nois is desirable. But, dear "Ubique," I must quare with one generalisation of yours: "Modern gear boxe are wonderfully satisfactory as regards noise." Yoshall just hear mine-post-war pukka 1919, and famous make. Did you ever hear a De Dion tricycl with a Dupont gear after it had done 20,000 miles?

Gear Box Mounting.

NCE more "Ubique" is perfectly correct i stating that it is a horrid nuisance to have t upset both chains when the front chain want attention. In this connection, he praises the Raleigl which has an immovable gear box and a slidabl engine. I have not owned one of the new Raleigh as yet, but I once had a 'bus designed on similar line in this particular respect. It is not generally realise that motor cycle frames are at least as liable to dis tortion as car frames, but I would go so far as t say that they distort inevitably, after a reasonabl amount of hardswear. So long as a belt figured i the drive, frame distortion did not matter a cent, unles it were serious enough to throw the wheels well ou of track and affect the steering. But with all-chair drive. frame distortion comes up to the footlights The 'bus which I have in mind distorted its' frame and put both chains out of line. Now it is possible within limits to set your back wheel a trifle askew in fact, most back wheels with 10,000 miles or at amateur chain adjuster to their name, are askew a this moment. It is less easy to skew an engine in the frame-wherefore this construction demands a frame which cannot distort or set. Incidentally, an engine requires very clever mounting if it is to be slidable with the same aplomb and accuracy which suffice to slide a gear box. The design is theoretically superb: but it is heavy work for the designer to get it flaw lessly expressed.

Three-wheelers, New and Old.

THE presence of so many new three-wheeled runabouts on the 1920 list is not at all surprising the only miracle is that the Morgan has enjoyed Fourteen years a practical monopoly for so long. ago there was a tremendous but transient boom ir machines of this type. I still do not know why the best of them—the 10-12 h.p. Lagonda—died, for there was very little the matter with it, even at that early date, though a usable second-hand car could be bought at the same price (about 160 guineas, if I Most of the other machines remember aright). suffered from many serious defects-weak brakes, dud clutches, accumulator ignition, inaccessible back wheels, a habit of over-turning if the rear wheel

Occasional Comments.-

punctured, etc. Nearly all of them mounted the second passenger forecar fashion, which was less sociable than a sidecar; moreover, it is bad manners to use your flapper as a buffer. The modern threewheeler offers car type weather protection, comfort nearly approaching car standards, and a specification which is quite as troubleproof as that of the sidecar, if not more so. It is unfortunate that these machines are at a special disadvantage in the trials where freak hills cause jolts for three-trackers which do not occur in ordinary riding, and also artificially intensify the problem of tyre grip to a point never attained in staid But the Morgan has always surmounted these special handicaps; and the newcomers may do the same if they do not try to transmit too much power through a single wheel.

An Illuminating Contrast.

UR sister journal, *The Autoiar*, maintains a henchman whose special business it is to keep an fait with air-cooling, and he spends much of his time in keeping in touch with experimental air-cooled cars. He tells me that the testers of one firm confess that engine seizure is a common occurrence in their routine work, and that he himself suffers the liveliest apprehensions when he is handling the chassis referred to. On the other hand, there are concerns engaged in this new branch of the industry which have yet to seize up their first engine, or even to induce a bout of pre-ignition. A designer will hand over one

of these engines to him, and tell him to maltreat it in any fashion which ingenuity can suggest, even up to the pitch of leaving it running in the garage overnight, and visiting it in the morning to see whether it was not finally stopped by a dry petrol tank, and is ready to resume running at once. My own experience of motor cycle engines is on all fours with his experience of cars. In the field of air-cooling there are three distinct types of designer, as follows:

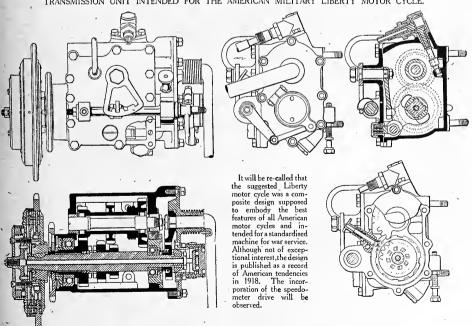

(t:) The man who does not understand air-cooling. His engine will often knock on a long hill.

(2.) The designer who understands air-cooling, but considers that his machine is roadworthy if it will take a sidecar up Sutton Bank at 15 m.p.h. on a hot day. This is good enough for the average user and the general market, but hardly good enough for an Λ.C.U. Six Days.

(3.) The designer who understands air-cooling, and considers that a commercial air-cooled motor cycle should run well when the piston temperature approaches 500° F.

The first type of designer still survives in the motor cycle industry, but will get squeezed out when the coming over-production and resultant slump ginger up competition. Type No. 2 has a rational excuse for his methods, and may adhere to them, even though the A.C.U. pundits misunderstand his ideas, subject his wares to extreme tests, and draw illegitimate conclusions from the net result. Type No. 3 appears to be the man of to-morrow. We shall see.

TRANSMISSION UNIT INTENDED FOR THE AMERICAN MILITARY LIBERTY MOTOR CYCLE.

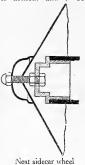

IDEAS: Useful and Ingenious.

Sidecar Wheel Disc Attach-

NEAT fitting for a disc on a side-car wheel may be made with an old cycle bell dome. The hub cap is drilled, and a bolt passed through

Neat sidecar wheel disc fitting made with a holt and a cycle bell

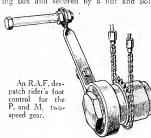

from the inside and secured with a nut. A suitable hole for the bolt drilled in the bell dome, and it is put in place after the disc is fitted over the holt. The whole is secured by a nut. Access to the tyre valve is obtained by removing the disc. A fitting such as this obviously limits the use of the disc to the sidecar wheel, to which it can only be fitted on the outside. -J. W. F.

Foot Operation for P. & M. Gear.

HORAN.

OOT operation for the P. and M. gear is easily arranged, and is a decided convenience when road conditions render it undesirable to release the handle-bars.

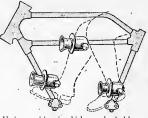

A strip of iron 9in, long ×1in, wide × in, thick is bent round the gear operating box and secured by a nut and bolt.

The outward end of the lever thus formed is twisted at right angles and drilled to take a gin, or in. bolt, which is secured by two nuts. Low gear is engaged by gently pressing the lever backwards, high gear by lifting with the toc of the boot. From the high gear free position is reached by giving a short sharp kick.—L. A. C. Perris, R.A.F., D.R.

A Foot Controlled Horn.

Y fixing the mechanical horn on the lower members of the frame the leg can be used to operate it, and necessity of releasing the hands from the handle-bars is removed.

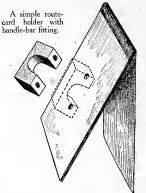

Various positions in which a mechanical horn may be attached for foot operation.

diagram shows three positions in which the horn may be fixed, so that by in-ward pressure of the leg the horn can Le operated .- C. McC.

Making a Route Card Holder.

OR long journeys over strange roads route card holders are very desirable. The main portion consists of a cigar box lid, and this is screwed to a block of wood about ain. thick, which is drilled

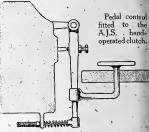

to fit over the handle-bar, and a cover of American cloth is tacked on to the top edge. A home-made holder is illustrated above. Drawing pins are used to secure the route card.—G. H. Northover.

Pedal Control for A.J.S. Clutch.

FOOT operation of A.J.S. and similar type clutches is often of great con venience, especially when gear chang ing, since the throttle may be manipulated more carefully when there is r need to release the right hand to contra

the gear lever.

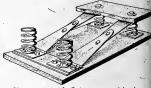

The sketch is self-explanatory, consists of a small pedal, easily forged by any blacksmith, brazed on to the clutt lever mounted on the gear box. As wi

be seen, the pad of the pedal comes clos to the end of the footboard, and is in mediately under the control of the rider heel.-J. D. O'HANLON.

A Home-made Fillion Seat.

THE feature of this pillion seat is th elimination of excessive side swa Essentially, the device consists two boards the size of the carrier. The boards are fitted to each other by tw pairs of hinges, the long arms of which are riveted together, as shown in the sketch.

Cheap and simple fittings are used in the making of this pillion seat.

Four ordinary cycle saddle springs at used between the boards, and these at held by nuts and holts passing through the hinges and boards. It is advisable to use large washers or thin iron structure to the holt heads and nuts in order the holt heads and nuts in order. under the bolt heads and nuts in orde to prevent cracking of the wood.—H DE M.C. STAINLESS STEEL FOR MOTOR CYCLES.

By DR. L. AITCHISON.

lts Composition and Possibilities for Constructional Purposes.

LL motor cyclists are now familiar with stainless steel. Almost wherever they go for lunch. or dinner they are provided with a stainless steel knife. Doubtless the average person says that the new cutlery is a remarkable invention, but probably only a few who use the steel knives imagine that stainless steel has any other uses than for cutlery. This is probably due to two causes. In the first place most people are aware that cutlery (other than stainless) is made from a special type of steel which is hard and capable of taking a good temper, and they are also aware that this kind of steel is never used for structural purposes at all. They therefore assume that stainless steel is similarly constituted, and, consequently, is not suitable for structural pur-The second reason which, in a great many cases, causes them to pass over stainless knives without reading fully the signs of the times which are embodied in these useful household articles, is a fairly widespread belief that the stainless property is something put on to the surface of the knife, and is not a virtue extending throughout the steel.

My purpose in this article is to suggest some directions in which stainless steel would be of conspicuous advantage to the motor cyclist. The obvious way to deal with such a matter is to divide the motor cycle into two halves, namely, the motor and the bicycle, and to deal with these separately. In order to appreciate, however, the following suggestions as to the application of the steel, it may be well to give a few facts about the steel, and to endeavour to establish at once the opinion that stainless steel has properties which will make it useful in other directions than the manufacture of cutlery.

Stainless steel is an alloy steel; that is to say, it contains, in addition to iron and carbon, which are the ordinary constituents of steel, a considerable percentage of another element, namely, chromium. In an ordinary table blade the amount of chromium which is present is probably about 12% to 13½%, and it is this high percentage of chromium, combined with the fact that there is not a very high percentage of carbon in the steel, which makes the material stainless and impervious to rust.

Ease of Hardening.

In consequence of the high percentage of chromium in it, stainless steel can be hardened very effectively, much more effectively than can the ordinary plain carbon steels which are used for most structural work. When it is stated that stainless can be hardened very effectively, two things may be inferred. The first is

that when hardened, stainless steel can be made to possess a very high tensile strength, and the second is that the method required for hardening stainless steel is very simple. To illustrate the latter point, a slight digression is necessary to explain how ordinary steel is hardened. Most steel which contains only carbon in addition to the iron is hardened by heating to a full red heat, and quenching in water. Sometimes, instead of quenching in water, the articles are quenched in oil. If the steel, however, is cooled in air from a full red heat, it is not hard at all, as the figures in the following table show distinctly.

PLAIN CARBON STEEL

		1.1	ALN UA	RBUN	D.T.	EEL.			
							Tensile		
							tons/sq	uare	inch.
Cooled	in	water					 	48	
,,	in	oil					 	38	
	in	air						28	

Stainless steel, like many other alloy steels, differs, however, from the carbon steel, in that it may be hardened fully by cooling it in air. In order to harden a piece of stainless steel completely, the only thing which it is necessary to do is to heat it to a temperature of about 900° C., i.e., 1,650° F., and allow it to cool in still air. When this is done, the tensile strength of the steel is about 110 tons per square inch, which is obviously much higher than can be obtained from the carbon steel by any method of cooling, whether it is quenched in water, in oil, or whether it is allowed to cool in the air.

Tempering.

It would, of course, be of very little use to the motor cyclist if stainless steel could be obtained only in such a condition that it has a tensile strength of over 100 tons per square inch. Stainless steel, however, is just like other steels, and can be softened or tempered by heating to various temperatures after it has been fully hardened. In the following table are shown the tensile strengths of stainless steel after it has been tempered at suitable temperatures: and in a parallel column are shown the corresponding strengths of plain carbon steel, such as is usually used for structural or engineering purposes after similar treatment.

			Tensile Sta	streng	th tons/so	uare in	ch.
Fully hardened -			*	105	***	48	.041
Tempered 400° (•••		100		45	
,, 500° (D	•••		92		38	
,, 600° ().	• • • •		62		34	
,, 700° (2.	•••	• • • •	54		- 30	
,, 750° (Э.			51		30	

From the table it will be obvious at once that stainless steel offers a considerable advantage in

Stainless Steel for Motor Cycles .-

strength over the ordinary steel, so that, apart from its main property, stainless steel can be seen to have many attractive points. The great virtue, however, of stainless steel is, of course, the fact that, after hardening and tempering and polishing, the steel does not corrode or rust under the attack of either the air or moisture, or sea-water, or weak acids, such as vinegar. This means at once that the effective strength of a part is considerably increased because no allowance need be made for rusting. In addition, it is not necessary to protect the parts made from it by means of paint or enamel or varnish, or any of the metal plating processes which are so frequently employed.

Where Stainless Steel could be used.

Turning now to the actual uses to which the steel may be put, the bicycle itself may be considered first. In the bicycle are the following main parts: the skeleton framework, the handle-bars, the brakes, and the wheels. In addition to these are the various brackets for lamps, etc., and the mudguards. The framework and handle-bars are generally made of mild steel tubing, which has tensile strength of approximately 24 tons per square inch. The brackets, where they are of steel, are made from mild steel of the same strength. The rims of the wheel are made from mild steel strip of about 30 tons per square inch strength (as it is cold-rolled), and the mudguards are made from strip of about 26 tons per square inch. The spokes of the wheels are made from steel about 75 tons per square inch tensile strength. Of these parts the ones to which stainless steel could be most profitably applied, taking into account the various methods of manufacture, are the framework, the handle-bars, the mudguards, and the brackets and similar fittings.

The Saving in Weight.

During the war the development of aircraft construction and design has shown the importance of conserving weight to the maximum degree possible, and, incidentally, has advanced the manufacture of tubes to a very great extent. Many aeroplane axle tubes are now required to be of about 85 tons tensile strength. This has resulted in an appreciable saving in weight. Why should not something similar be effected in the case of the motor cycle and by the use of stainless steel? It would not be impossible to make stainless tubes of 85 tons strength, but it would be easier to make them of about 60 tons. This means that the present steel of about 26 tons strength would be replaced by one of about 60 tons: more than twice in the strength. This is bound to result in a reduction of the weight of the part materially, even though it does not mean a reduction to a half. This in itself is very well worth considering. Add to this advantage, however, the fact that the material is stainless, and weights can be reduced still further. Plating and enamel do not weigh much, but they weigh something, and every.

Plating and Enamelling Unnecessary.

The second great advantage following from the use of stainless steel for the framework and handle-bars of the bicycle is that the use of this material would obviate completely the necessity for enamelling or plating the parts. This would be of some considerable consequence in the initial cost of the parts. Besides

the initial cost, however, the use of stainless steel would do away with repairs and renovations of the enamel or plating, and the parts would always be bright and clean. This is surely a very great advantage, and, when taken in conjunction with the great gain in strength which could be achieved by the use of stainless steel, suggests that the utilisation of this material presents considerable advantages.

The Price Question.

It must, of course, be admitted at once that stainless steel is distinctly more expensive than mild steel, and also it must be admitted that, although there is a possibility of the price of stainless steel being reduced distinctly from its present level, yet there is no likelihood of it ever competing with mild steel as regards' price. The price, however, of an article is by no means fixed by the price of the raw material from which the article is made. As stated above, by the use of stainless steel, the weight of the parts would be considerably reduced, less material would, therefore, be required, and hence the price of the finished article would not be so high as might be expected from a direct comparison of the prices of the raw material in billet form. When cost is being considered, the cost of enamelling and plating must be taken into account, and set off against the extra price of the material. It appears possible, therefore, that when all these points are taken into account, the stainless steel frame and handle-bars would not cost a great deal more in the long run than those in the ordinary steel.

When other parts of the bicycle, such as mudguards or brackets, etc., are considered, there can be little doubt that stainless steel would have considerable advantages from the point of view of lack of rusting. By creating a demand for the type of stainless steel which would be suitable for mudguards, the price would be reduced considerably. In this case strength questions are of no great importance, but freedom from rust plays a considerable part. Even with the best enamelling, mudguards generally present rather a poor appearance after a time, and it appears very well worth while to consider the use of a material which would never rust, even after years of service.

Stainless Steel in the Engine.

The above remarks have been confined exclusively to the utilisation of stainless steel in the cycle as distinct from the engine. When the engine is considered, it can be said right away that there is probably hardly a single part (with the possible exception of the pistons) which could not be made from stainless steel. There is, however, no need to use this material for ja great many of these parts, since their liability to corrosion is small, the parts being enclosed and running under conditions giving suitable lubrication. steel, however, is of considerable use in connection with valves, and it is hoped that this subject may be dealt with in a separate article. In fact the general application of stainless steel to the engines should be dealt with separately. It may be taken, however, as a fairly safe statement that if corrosion is being experienced on any of the exposed parts of an engine, the use of stainless steel for this part, in order to overcome this corrosion, should be very carefully considered, and it will probably be found that, if it be adopted, the corrosion troubles will be overcome.

The First 1000 Miles on a Mechanically Lubricated P& M

THOUGH owing to the early date of its delivery my machine was minus one or two of the improvements that have since been carried into effect on the post-war model, it belongs, so far as these notes are concerned, to the post-war category, for the power unit throughout is the new model, which made its $d\ell but$ in the A.C.U. Six Days Trials.

The conditions of riding in France left many of us when the war ended in the possession of an almost morbid thirst for something reliable—something endlessly reliable, which would jog us through the genial monotony of everyday life with never an anxious thought or an irksome moment. That, I suppose, was why I bought a P. and M.—not, perhaps, without certain misgivings. An impression of bygone days has never classed the P. and M. as among the antelopes of the road. They were renowned, rather, for always getting there on a minimum of petrol and a maximum of oil. Twin-cylinder enthusiasts talked about the vibration. I was among them. When I bought the P. and M., it was in a spirit of preparedness as concerned accepting a certain amount of vibration in return for the numerous and unquestionable advantages of the breed, and I was prepared to feel it badly, as the previous mount was a twin-cylinder which, theoretically, was a perfectly balanced engine except for a "negligible couple."

Absence of Period.

Mounting the new P. and M., however, I was very pleasantly surprised to discover that it did not vibrate This was the first impression, and it has been a lasting one. Old P. and M. riders who try the new model have a treat in store, and, personally, as a flat twin maniac. I had no idea that it was possible to balance a single-cylinder engine so perfectly as this post-war model is balanced. Either the manufacturers have accomplished the impossible by ruling out the "inevitable period," about which the knuts talk, or they have shifted it so high up the scale of revs. that none but the topmost knuttiest of the knuts will ever find it. Perhaps that is a slight exaggeration, but, at any rate, the engine is vibrationless at the speeds one ordinarily drives a P. and M., while at higher speed it is negligible. Certainly, it is better balanced than any of the pre-war V twins, and this. I believe, applies to at least two other of the best present-day singles. .

Silence.

Of recent years quiet running has been a great point in favour of P. and M. machines. Considerable comment has been passed on their silence, and, so far as mechanical sounds are concerned, the new model is distinctly more silent than its silent predecessors. The forced lubrication has a good deal to do with this, but of that more anon. As regards exhaust noises, it is somewhat difficult to judge. Throttled

Being the Road Impressions of a Practical Rider on a Practical Mount.

down, the new engine turns over like a sewing machine, but it has a considerably bigger kick than the R.A.F. model—it is, in fact, a more powerful engine—and therefore, when the throttle is opened, the natural response comes by way of a healthier bark. Its usual method of progress, however, leaves nothing to be desired, and generous throttle openings are sufficiently infrequent to be negligible.

Road Speed.

The new model looks what it is, a thoroughly practical road proposition of genuine British design and finish. I hold no brief for P. and M.'s, but it is really time that old-day impressions as regards the speed of these mounts went their way. Up till about 1913, P. and M.'s were as monotonously slow as they were monotonously reliable. The two were inseparable. They traded on their slowness, and thereon built up their reliability. The makers had decided how many fluffy, woolly "ploffs" per minute were good for you, and you could get no more. You could jam open the throttle, waggle the air, sit on the joystick, but it went on "ploffing" at the same indifferent speed. Those days are gone, and for some" years past the aim of the makers has been to obtain a single of as great an all-round efficiency as any other single, without sacrificing any of the original properties. How far they have succeeded the present model shows. My mount is standard, but it is really a "hot-stuff" single. Several of the genuine speed "nobs" have marvelled at the manner in which it will rev.-and keep on revving over long distances. With a loaded sidecar it is not, of course, fast. The least head wind brings down the average enormously, as three speeds are essential for even a moderate average with so small an engine. With an empty sidecar and no head wind it is faster than most big twins with loaded sidecar, because one can stick on top gear and simply rev. An experiment in this direction proved a great surprise. I was riding up from Bradford to Scotland with the sidecar containing only "emigrants' effects." On the up grade after Settle, a big American twin with moderately loaded sidecar passed me with a look of contempt from its rider. "All right, my son," I thought, "now you'll have to keep moving all the way to Scotland!"

A good open road, no wind, glorious weather, and I continued to ride at the same speed as previously. Probably the P. and M. and the American were geared

The First 1,000 Miles on a Mechanically Lubricated P.&M.—about the same. It was merely a matter of engine speed. All manner of queer remains in the way of sidecar outfits were passed on the way, and presently it was quite evident that the driver of the American was doing a little more than he had intended. On a long level the P. and M. drew up alongside, and out of the corner of one eye the American was observed to be desperately twiddling twiddly bits and pulling strings. The last ten miles, however, had proved too much for the big engine. It simply could not stick the ress., and fell ignominiously to the rear.

At Carlisle I pulled up for petrol—the big twin ticked in later, and numerous tentative enquiries were made as to whether the P. and M. was standard. This little anecdote is related not by way of inviting jibes from the big twin enthusiasts, but simply to illustrate the point that the new P. and M. is not slow, and, further, as showing that there is a good deal of truth in the statements of certain single-cylinder

experts to the effect that when it comes to a matter purely of revolutions the average big twin simply cannot stand up to a well made single beyond a certain distance.

Pending improvements, the P. and M. engine should mark an era of additional vitality, and it remains only to be said that where one finds difficulty in keeping pace with other good machines is on such a trial as the Scottish Six Days, when the absence of a middle gear inevitably results in periodical and stupendous "blinds."

Mechanical Lubrication.

Though the reader may be becoming fed up with favourable comments, he must endure a few more

adjectives till we are through with this paragraph. A lubricating trouble with P. and M. engines hitherto has been the drying of the top side of the piston. This alone accounted for their high oil consumption, as, in order to keep the top side of the piston anything like adequately lubricated, it was necessary to maintain a larger quantity of oil in the crank case than would otherwise have been necessary. Because the engine had one dry spot it was necessary to keep the rest Even then the top side was alternatively swimming. dry and half dry. A little exaggeration may be pardoned in order to emphasise the point, but examine the piston of any P. and M. prior to the post-war model, and that a dry side existed is evident at a glance. This, of course, led to uneven wear and an irritating piston tap, quite apart from loss of efficiency and high oil consumption, while the high oil consumption correspondingly led to the necessity for frequent decarbonisations.

These points could, perhaps, be ignored previous to the present era of perfection, but the fact that the new system of lubrication has removed them is an important step. I cannot say whether my machine acquires less carbon deposit than the present model, because, living in the mountains, and generally using a side-car. I habitually over-cil, but certainly it does not carbon up quickly. That the forced lubrication has

improved the engine enormously is a fact any tyro could perceive. At all times it runs with the silken smoothness suggestive of night riding, and which indicates perfect lubrication—i.e., that a steady flow of oil is reaching the spots where it is required. A constant feed goes to the top side of the piston walls, the original dry spot, and thus the dry spot is ruled out, while the second force feed goes to the big end.

The ruling out of that dry spot is an enormously important point. Hitherto P. and M. engines have been fitted with pistons on the tight side in order to reduce the piston tap, which came in the end anyway. This is no longer necessary; the advantages of a free piston can be enjoyed without irritating mechanical noises and without excessive wear. In point of fact, the present piston is so well lubricated that it wears imperceptibly, as the following will show.

Reliability of the System.

When my machine was first turned out it was fitted,

in error, with the usual P. and M. tight piston. After 1,000 miles of hard riding, I one day accidentally left the oil turned off, and, though there was a sufficient supply in the crank case, the piston dried up almost immediately, indicating that, after 1,000 miles, it had not run in sufficiently to take off its initial newness. Again, at a more recent date, I accidentally ran out of oil, and again the piston dried up immediately.

This brings us to another point. Riders of the old school are still sceptical about mechanical lubrication. "What if the pump fails, and you ride on without knowing it?" they ask. The reply is, "The pump is never likely to fail, and if

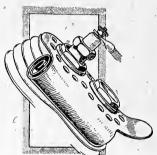

it does you will know about it in double quick time."
The piston will dry up long before any other damage will occur, because a mechanically libricated piston

never becomes a really sloppy fit.

The pump under discussion camot very well fail. It contains no valves nor springs, is simply a little solid plunger reciprocating and rotating in a little solid tube, and the only conceivable manner in which it can give up the ghost is by stripping its pinion; and you are just as likely to strip the magneto or half-time pinion. Should this occur to some luckless vagabond, he can very easily strip off his pump, send it to the makers, and go on riding by the use of his hand pump, as he did when he was a boy. It may be added that the lubrication now employed has been in use on machines (not served to the public) since 1914, and first proved itself on the P. and M. twin.

Practically all the points one would criticise on this attractive and serviceable machine are to be washed out on the post, war model the public will get. The R.A.F. model kick-starter left a good deal to-be desired. Sometimes one kicked with effect, sometimes one kicked the air and, in effect, almost broke one's ankle. Its chief weakness lay in the fact that the public seemed incapable of grasping the one or two

An additional cooling device fitted to the author's P. and M - It consists of sheet copper and fits under the valve caps.

The First 1,000 Miles on a Mechanically Lubricated P. & M.—adjustments provided, and on which its satisfactory working depended. The new kick-starter is a big, husky ratchet affair, which swings the engine over half-a-dozen times. It is neat and infallible.

Some Points for Improvement.

One recalls also having to hang head downwards between the machine and the sidecar in order to remove oily little screws and an ornamental cover in order to inject oil with an oily injector through a red elbow and into the gear—the sort of circus trick the public ought not to be called upon to perform. That, too, is gone. The new gear is provided with a big roller bearing packed with grease and requires no attention from the beginning of the scason to the end.

The front mudguard remains the same-a blot in an emerald landscape. It might profitably have been redesigned five years ago. There is so little tyre clearance that, unknown to the rider, a stone can jam between it and the cover, and cut the front tyre all the way round—as has happened in my case. Wider guards and larger tyres are really needed. friction shock absorber either absorbs nothing at all or it absorbs the whole drive. If perfectly adjusted, it remains so for about 100 miles, gradually slipping more and more till at 150 miles one has to get out hammers and crowbars to tighten up the whole affair. Every practical P. and M. rider I know keeps the lock nuts rammed home, and rides with a solid drive, but this is also, I learn, to be superseded by a shock absorber of the mechanical and unadjustable type, which is bound to function, and to function always.

The B. and B. variable jet carburetter is, perhaps, the writer's favourite on account of its economy, wide range of adjustment, and general efficiency. The only

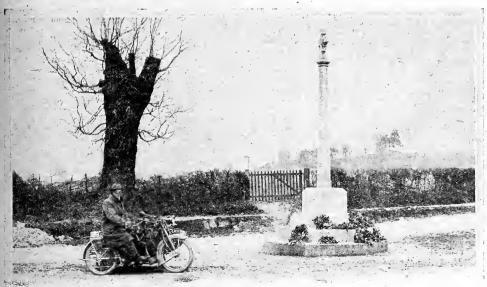

trouble with it is that one is never sure of the best position of the levers for an easy start. The best position to-day may prove hopeless on Saturday next, and once having properly middled the mixture, it is necessary to make a clean sweep and start all over again. Even with this defect, the variable jet is miles above most other designs.

The E.I.C. magneto has given no trouble. It seems a thoroughly sound proposition, but it will be more appreciated when British manufacturers get away from minute adjustment screws.

Economy.

A machine of the type under review probably affords the cheapest possible travelling for two. A 3½ h.p. two-speed is not, of course, ideal for sidecar work, though the climbing abilities of this mount are equal to anything but the most freakish conditions. Heavy winter roads and winter winds are the real trial.

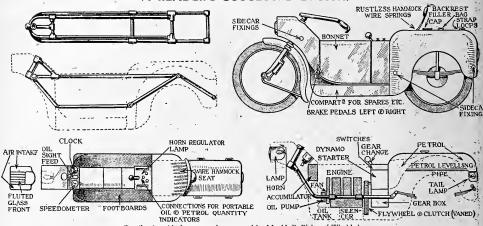

The reason why the P, and M, sidecar and one or two others of its class are essentially adapted to the poor man's requirements are, first, because they are absurdly cheap to run and, secondly, because they fetch good second-hand prices. The market value of a well-used P. and M. falls very slowly. At the end of two years, if it has been well kept, one should have very little to write off as depreciation. With luck, repair bills and renewals run to only a few shillings per year, and petrol and oil consumption is very low. From Peebles to Skipton via Carlisle and Kendal, with passenger and luggage, our petrol consumption panned out at 108 m.p.g. From Peebles to Glasgow via Lanark, through mud and against wind, it once dropped to 62 m.p.g.—the lowest yet. Oil consumption has not been measured, but I should say it is roughly just over half what it was with the R.A.F. models. CHINOOK:

. A war memorial in the village of Lugwardine, Herefordshire. It has thirty-two names on it—a large total for a village of only a few houses.

A Highly Developed Motor Bicycle.

A READER'S SUGGESTED DESIGN.

Details of an ideal motor cycle suggested by Mr. H. P. Blake, of Wimbledon.

S OME years ago Mr. H. P. Blake, of Wimbledon, sent us a model and sketches demonstrating his ideas of a motor bicycle de luxe; and the attention recently devoted to this topic by The Times and ourselves has moved him to submit the accompanying specification and sketches, which he places freely at the disposal of anybody who may be intercested, since he is unable to develop the design for himself.

The general view shows a smooth-sided casing of Duralumin utilised to conceal an ordinary frame of steel tubing. The whole of the mechanism and accessories are protected and hidden by this casing, so that the machine does not look "spiky," and is very easily cleaned after a dirty ride. The back wheel is carried on semi-clliptic leaf springs, a U tube being carried up from the rear forks to the tail of the main frame in order to prevent lateral sway when cornering. The front wheel is trailed caster fashion, with its springs concealed in telescopic tubes.

A vertical three-cylinder engine of the two-stroke type is suggested, driving the rear wheel through a four-speed gear box and enclosed shaft. A combination electrical outfit would cater for ignition, engine starting, and lighting.

The cowl surrounding the steering head houses three items, viz., the head lamp (which has a dimming device), the electric hooter, and the air intake to the fan which cools the encased engine.

The frame is narrow, the rider's legs being outside the engine cowl. The footrests are carried up in a slow curve at the front end to form mudshields, and lockers beneath the footboards are utilised for the

storage of tools and spare parts.

The lubricating oil tank is set low down between the footboard lockers, the oil being pumped to the engine via a sight-feed mounted on the dash or instrument board. The dash also carries a sunk speedometer and clock, together with the adjustment for the

oil-feed. An unusual petrol tank of 3½ galloris capacity is mounted above the rear wheel, its fore and aft bottom levels being connected by an equalising pipe concealed under the Duralumin cowling. The registration numbers are, of course, painted on the cowling, and the tail lamp is built into the rear of the petrol tank.

The handle-bar controls would naturally be of the concealed type, viz., twist grips or thumb slides.

In lieu of a saddle, a hammock seat of cycle car pattern is suggested, but the use of rustless steel links is preferred to leather.

The approximate dimensions are:

Wheelbase, 56in.
Saddle, to footboards, 17in.
Ground clearance, 7in.
Wheels. 28 × 3in.
Width of bonnet, 7½in.
Width of petrol tank, 12in.

Maximum width (across footboards), 14in.

Such a machine, it is claimed, should not be appreciably heavier than a conventional mount of equal horse-power, since the light cowling would not weigh much more than the numerous fittings required to carry the parts as usually arranged.

Perfection in Motor Cycles.

It will be interesting to see how far Mr. Blake's design conforms to readers' notions of a machine de luxe. His specification is tantamount to a heavy-weight built with two special points of emphasis, viz., ease of cleaning and disregard of cost. But the cache of the Rolls-Royce car—so often quoted as the zenith of motoring luxury—is not unconventionality in general outline, but the perfection of a normal first-class design by dint of first-class material, first-class workmanship, and incessant testing. It follows that a Rolls-Royce motor bicycle need not be unconventional. The policy might imply no more than the following points:

A Highly Developed Motor Blcycle.-

(1.) Limited output.

(2.) High price.

(3.) Vibrationless engine.

(4.) Vibrationless frame.

(5.) Ten hours' bench test of each engine.
(6.) 500 miles road test of each machine.

The quality of the machine would then embody a host of minor perfections, which cannot all be guaranteed in a cheap machine built on the quantity system. For example, it would have no oil leaks at the tappet

guides or crank case joints; it would never soot a plug; its carburetter would not flood until, say, the third season; it would be impossible to adjust the back wheel out of track with the front wheel; it would tick over at 75 r.p.m. in neutral; its clutch could be operated with one finger, but would not slip within 20,000 miles; it would not carbonise its cylinder in less than a full season's riding; its wheels would be interchangeable within sixty seconds, etc., etc. Nevertheless, it might closely resemble in outward appearance one of our standard production machines.

OUR EXPORT TRADE.

BOTH IMPORTS AND EXPORTS ON THE INCREASE.

THIS year will mark the resumption of trade in Overseas markets on a scale fitting the nation that turns out the world's finest-machines. Last year, of course, an effort was made to fulfil a small percentage of the Overseas orders im-hand, but the few machines exported did little to satisfy the ever-increasing demand, the number exported being, roughly, half of those in 1913. Many have been the criticisms levelled at British makers at their efforts at building up Empire trade. Lethargy, indifference, and shortsightedness, have been among the accusations advanced by Overseas motor cyclists, the greatest grievance probably being the spare part question.

We have been told that in a few years time British trade will be entirely eclipsed by American, that our antiquated methods will result in the total ruin of the pioneer work performed by a few British firms years ago. Yet, in spite of all this condemnation and rather tiring tirade, in spite of the American trade organisation, and the magnificent opportunity they had of penetrating our reserves during the early part of the war, the demand for British machines is as firm as ever. When British motor cycles are sent out-whether to South Africa, New Zealand, India, or Canadathey are snapped up in spite of price and the socalled bad spare service. That fact speaks for itself. The demand is there, and will unquestionably remain so long as our machines maintain their high standard and workmanship.

British Service Abroad.

There is room for much improvement in British service abroad without a doubt, but the many grumbles heard are uttered without giving thought to the obstacles that confront the comparatively small and individual manufacturer in his effort to supply a world market. These obstacles will be overcome when British firms combine in their efforts to form central spare depots in various countries—a scheme we discussed some months ago, and to which reference will be made at a later date—and when the strangling effect of labour troubles is overcome.

The coming year British makers will have great difficulty in meeting the demands of the home market, but the wise manufacturer, who is looking right ahead, will make provisions for maintaining or building up goodwill abroad. There will be an ever-increasing demand at home for machines: a demand that is likely to lull to sleep the faculty for a full realisation

of the gigantic possibilities of "foreign" demand, for not only is there the white population of such places as India and China to consider, but also the coloured races. Let it be remembered that the enlightened population of India and China is a large one, and, judging from correspondents' letters, it is interested in the cheap and simple type of motor cycle. The world's demands for motor cycles is huge, and the makers who have imagination, mettle, and push, will reap a big reward: there is no question whatever on that point.

Exports for 1919.

So far as export trade for the last year is concerned, no remarkable feature presents itself on studying the figures. It will be observed from the table below that about half the number of machines were exported last year compared with 1913, but their value was nearly £160,000 more.

Compared with the month of November, last month's figures show a very slight decline, the number of machines exported being 838, their value, together with parts, accessories, tyres, and tubes, amounting to £115,035.

AIR-COOLING UP-TO-DATE.

By "ROAD R!DER."

Modern Views on the Question of Heat Conductivity and the Selection of Materials.

T is not a mere accident that several prospective motor cycle engines are to be fitted with detachable heads; nor has this ancient system of construction been revived solely or mainly to facilitate decarbonisation, or to permit the interior surface of the combustion chamber to be machined. A little consideration will show that a detachable head is essential to full cooling efficiency.

Where "hotstuff" engines are concerned, it is desirable to keep the inlet pocket as cold as possible. It is true that a portion of the inlet pipe should be well heated, to assist vaporisation of the fuel on any type of engine, and to ensure equal distribution of the charge to the several inlet valves of a multi-cylinder. But if the inlet valve pocket is really hot, it is impossible for the engine to inhale a maximum charge, since heat expands the gases; and the inlet valve is open for a miserably brief period at the best. Consequently the inlet pipe should be heated close to the carburetter, and cooled near the valve. For this reason it is desirable to prevent the inevitable heat of the ex-

haust valve pocket from raising the neighbourhood of the inlet valve to a very high temperature. If the cylinder head is made of a metal possessing a high degree of conductivity, e.g., aluminium, the temperatures of the inlet and exhaust valvepockets will be approximately equal, which is undesirable. On the other hand, if the cylinder head is made of cast iron, which possesses comparatively low heat conductivity, the inlet valve will keep fairly cool, and the heat of the exhaust valve will be isolated, and the cylinder head will expand unevenly.

A Composite Cylinder.

A recent patent solves this dilemma with satisfactory results. A one-piece cylinder of aluminium will suffer from too hot an inlet valve, with resultant wire drawing of the charge. A one-piece cylinder of cast iron will tend to distort eggshaped with its long diameter bi-

secting the exhaust valve, with consequent piston friction. Hence a detachable head is clearly indicated as the road towards a solution.

The nature of the problem is absurdly simple. Theoretically, the cylinder head should be hot on one side and cool on the other, for reasons already stated:

while the cylinder barrel should be of an even temperature all round to avoid distortion and piston friction. In other words, the designer must devise a detachable head which will not pass on uneven heating to the cylinder barrel. Any type of joint between head and barrel interferes to some extent with the flow of heat from one part to the other: the best made faced joint is an insulator of heat to some extent; racing sparking plugs are made with one-piece electrodes to secure the most rapid conduction of heat and so to prevent the points from becoming incandescent and causing preignition. Hence some designers deliberately fit a type of head-to-barrel joint which is a bad heat conductor. Such a joint is necessarily apt to leak; since the hot exhaust side of the head is expanding away from the cool inlet side, and exerting a sideways pull. The patent, above referred to, embodies a thickish aluminium washer of considerable diameter between a cast iron head and a steel barrel. Aluminium possesses splendid heat conductivity, and measurements

of temperature on the top and bottom sides of this washer are very interesting. At the top the exhaust side of the washer is appreciably the hotter: at the bottom there is no material difference between the temperatures on the two sides. In other words, this washer puts the heat into equilibrium before communicating it to the steel cylinder barrel. Thus all three desiderata are obtained, viz.:

i. A cool inlet valve pocket.

2. Full internal machining of the combustion head.

3. A symmetrical piston path under full load.

. It is doubtful whether any other method of construction at present in use fulfils all these requirements quite so satisfactorily.

CONSIDERABLE CAST IRON CYLINDER HEAD WARM COOL EXHAUST INLET ALUMINIUM CYLINDER HEAD CYLINDER HEAD

Relative distortion of cast iron and aluminium cylinders (exaggerated).

Piston Temperature.

In the second place, it is equally necessary to maintain the whole area of the piston at as even a tempera-

ture as possible. In pre-war motor cycle engines this necessity was fully realised, but clumsily tackled. The designer's main expedients consisted of:

Drenching the cylinder walls with oil.
 Retaining the hand lubrication system, simply because it furnished cold oil at periodic intervals.

Air-cooling Up-to-date .--

3. Spraying the interior of the piston with oil.

4. Compensating for the excessive expansion of the red-hot crown of the piston by giving the top "land" of the piston from corin. to cogin. more clearance in the cylinder than the lower "lands" (i.e., using a "tapered" Crownst MEET ?

piston). All these expedients were faulty. For ex-

ample:

1. Created excessive piston friction, as the tight-fitting rings had to overcome the resistance of a "wave" of oil which they squeezed along the cylinder walls on both the up and the down stroke: led to rapid carbonisation; produced absurd oil consumption.

2. Gave the rider trouble which no car driver would tolerate: 75% of motor cycle engines were either under or over lubricated.

under or over lubricated.

3. Exaggerated the overheating of the piston as soon as carbon crusts formed under the piston crown (few riders removed these crusts during amateur overhauls) and produced excessive oil consumption.

(A) Cast iron head

(C) Steel cylinder.

(B) Aluminium washer

4. Rendered the second ring from the top the real "compression guard" whenever the engine was cold, and the top edge of the piston had not yet expanded to fit the cylinder bore. For this reason the second ring bore heavy responsibilities, and three rings became advisable. Moreover, the two top lands and rings carbonised heavily, and after a few hundred miles this *arbon wiped out the extra clearance.

Experiments Five Years Ago.

Quite five years ago a number of piston experiments were in progress, though it is doubtful whether even their originators fully understood the factors by which they achieved notable successes. The three principal innovations were the recessed or

Aluminium piston with crypt-type internal ribs for cooling piston head.

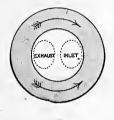

mnovations were the recessed or drilled steel piston, the aluminium piston, and the scraper ring. The steel piston with a recessed waist ranged from the Rudge pattern, on which the "waist" was barely noticeable, to the Zephyr patent, which resembled an hour glass: in between these extreme patterns came all manner of "perforated jam jars." Some inventors claimed improved efficiency as the result of the lightness of

their designs, others emphasised the fact that their perforated piston skirts made for improved lubrication of the cylinder walls. In practically every case the main merit was the fact that the harassed piston rings were able to get rid of the waves of compressed oil which they had pushed in front of them for years. Similarly, the original devotees of the aluminium piston made great play with learned

talk about the lightness of the reciprocating parts. In one experiment aluminium pistons, weighing considerably less than the steel pistons which they superseded, made no perceptible difference in the running whatsoever, except when the engine was cold and their excessive clearance caused them to "slap" quite audibly

until they had warmed up "and grown" to a better

It follows that the prime essential in piston design is to get rid of the oil friction as far as possible. This implies proper cooling of the piston; otherwise cutting down the supply of oil will lead to scizure.

Arrows show circumferential radiation of heat in aluminium washer.

Getting the Heat from the Piston Head.

Since the crown of a piston is subjected to enormous heat, and the skirt is protected from direct contact with the explosion flame, it is essential to use

a metal of high heat conductivity; and in this respect aluminium has cast iron beat to a frazzle, and is suitable in all other respects. The main value of the earliest aluminium pistons was their superior heat conductivity, considerably assisted by the inevitable thickness of their skirts, since a thin aluminium skirt would not bear the load.

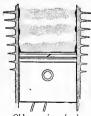

Drilling a piston impairs its heat conductivity. The holes narrow the path by which the heat struggles to flow from the head to the skirt. From a thermal standpoint this device is as foolish as trying to empty the Chelsea football ground quickly after a cup-tie by keeping half the exits shut.

Secondly, the interior of a piston should be heavily ribbed; not to withstand the thrust of the explosion, but to conduct heat from the centre of the piston crown into the base of the skirt. On some of the Sunbeam

aircraft engines a metal stud connects the piston crown to the gudgeon pin. A superior practice is to web the whole of the crown to the skirt in a fashion reminiscent of the groining of the roof of a crypt.

If an aluminium piston designed on these lines should weigh more than the cast iron piston which it supersedes, the engine will nevertheless be improved. If, in addition, the aluminium piston weighs less, additional revolutions will be

obtainable.

Old type piston forcing waves of oil (exaggerated diagram) up the cylinder bore on each upstroke.

The famous Ricardo piston, known as the "slipper" type, reduces the oil friction to a minimum by dispensing with a skirt except for two brief panels on the pressure sides. Mr. Ricardo has also patented a "trunk" piston, which has no skirt at all: the rings are carried on a shallow cap, and the bearing surfaces lower down are out of range of high temperatures.

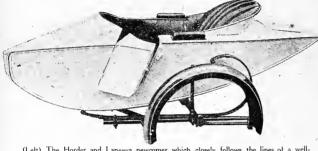

CHOOSING A TOURING SIDECAR.

Some Details concerning Sidecars are Discussed by a Practical

PERHAPS it is unnecessary to go into the reasons which impelled the writer to consider the necessity of choosing a sidecar, since they appear to crop up eventually in the life history of every motor cyclist. Let it suffice to mention the fact that whatever attachment was ultimately decided upon a certain amount of luggage had to be carried without interfering with the

To this end, a large collection of sidecar manufacturers' literature was gathered

together and perused.

(Lett) The Horder and Lane—a newcomer which closely follows the lines of a well-known French sidecar. (Right) The Rover sidecar, which is one of the many fitted with a luggage carrier on the body itself

In the first place, the writer is an ardent solo enthusiast, who regards the sidecar as a necessary evil which will persist concurrently with the continued existence of the social (and sociable) instinct.

Following this confession, it may be assumed that a critical eye was brought to bear upon the sidecars described, and so much as this may be said at once—that the writer found so little to criticise and so much worthy of praise that he became quite disgruntled, feeling that the day of the meticulous scribe was ending.

Luggage Grids.

Regarding sidecars in general, one distinctly noticeable feature must be mentioned. Hitherto the carrying of luggage has been a difficulty with the touring sidecarist. Most luggage grids were mere extensions of the rigid chassis, and were ultimately of greatest value to suit case makers—even a solid steel case could not be guaranteed to withstand the chafing of a tour to the North of Scotland or a week of mountaineering amongst the Lakes.

The 1920 catalogues reveal a change. With few exceptions the luggage grid, such as is fitted to almost all the best class of machines, is mounted on the body itself, thus insulating it from vibration in the same degree as the passenger is insulated. One firm, the Rudge, goes even so far as to mount the body on the spring luggage grid as it were, since the main springs carry a frame which rearwardly is the grid, while in front it forms

a support for the body. The mudguard is also mounted on this, and is likewise removed from the effects of the road wheel vibration.

Another ingenious arrangement, as effective as it is unobtrusive, is the concealed luggage platform on the Millford

de luxe sidecar. The popular bulbous back variety, and if luggage has to be carried the back may be let down and retained at right angles by the same strap which secures the suit cases. A tool hox is also hidden in this arrangement.

Another sidecar embodying, a tool drawer with the grid is the A.J.S., which has a convenient rear platform attached to the back of the body immediately below the spare wheel carrier. Since A.J.S. machines receive such arduous testing in public competitions, they are replete with the details suggested by practical road experience, and that mentioned is undoubtedly one.

Spare wheel carrying is somewhat of a problem if other im-

pedimenta are to be accommodated, and the Excelsior people meet the case in a very cute manner. In the centre of the folding grid is a lng bored and tapped with a screw thread. A bolt, which goes through the hollow centre of the wheel, is screwed into this, so that when the grid is in use the wheel is horizontally beneth it.

Epring Wheels.

Sidecar wheel springing has likewise received much attention in these later days, and more than one firm produce thoroughly sound springing systems. Grindlay sidecars have double leaf springs which insulate everything but the wheel itself, while the Henderson, which has the wheel and axle spring, only carries 11 lb. dead weight. The Bamco leaf spring model has the stub axle mounted at the centre of a heavy laminated half-elliptic, and is extremely simple. Clyno and A.B.C. outfits have sidecars with

On the Royal Ruby, special attention has been given to the carriage of petrol tins.

MOTOR CYCLE

Ch. osing a Touring Sidecar .-

wheels supported on quarter-elliptic leaf springs, while the Matchless embodies coll springs, all these work in unison with the motor cycle frame springing.

The general tendency to support the wheel his spindle at its outer end is probably largely due to the growing favour of detachable wheels, and a good point in this connection is to be seen on the Rex chassis. Here the outer member of the frame encircling the wheel is detachable, this making for easy withdrawal of the wheel.

Bodywork.

Bodywork generally much improves, and some excellent finish is to be seen. The pumple Scott sidecar, for instance, is made up with aluminium panels and is extremely light. Norton sidecars can be had with a large rounded back which opens out to form a dickey seat, while, in the matter of weather protection, there is every refinement to appeal to the most sybaritic passenger. He (or she, we must say) can choose between the extreme at the one end represented by the open sidecar with a simple screen like the Easting passing through the intermediary ground covered by the touring types with hoods, windscreens, and side curtains, on to the other end of the scale, where we find the complete sidecar-limousine type of body.

imousine type of body.

As stated in the prefatory remarks, the writer is something of a solo enthusiast of the all-weather type, and,

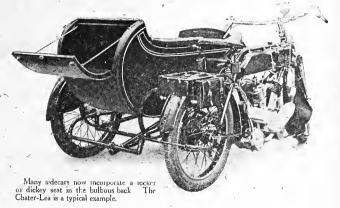

although the enclosed, glass-sided hody appeals to him as a commercially valuable innovation for sidecar work, he would be most distinctly affected by the contrast of his position with that of the passenger if he chanced to be driving such an outfit regularly in Manchester or any of those places on which popular repute bestows a ceaseless downpour.

In conclusion, even this very cursory glance over the catalogues is sufficient to give one food for reflection on the

advanced state of sidecar design to which our manufacturers have attained in the comparatively short period since the exit of the once-popular basket body. Actually the sidecar has not yet been

Actually the sidecar has not yet been chosen, because it has been decided that the most important point is the colonr, and a more influential personage has informed the writer that it must be selected next spring in accordance with the prevailing fashion in complexions at that date.

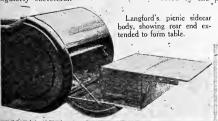

WHARFFEALE.

A PICNIC SIDECAR.

WE have often urged sidecar manufacturers to consider the demand which undoubtedly exists for a sidecar embodying equipment for the large number of motor cyclists, who during the summer months make a practice of taking their meals in the open. On the score of economy alone, the picnic has much to commend it, but apart from this question the majority of motor cyclists' wives prefer to cater for themselves, when they are sure of obtaining meals exactly to their liking at no greater expense than if they stayed at home. So far, however, accommodation for the picnic equipment has been a matter

So far, however, accommodation for the picnic equipment has been a matter for the sidecar owner to arrange as best he could, and especially where a sprung grid is not fitted it has not been easy. As we have frequently pointed out, it is a problem for designers of sidecars to solve, and in this connection the Langford Sidecar Body and Chassis Co., Londom Road, Norbury, appear to have been singularly successful.

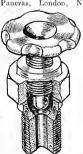

To provide a comfortable sidecar capable of carrying fuel, oil, and spares for long-distance touring, and suitable equipment for a picnic, a most ingenious and compact arrangement has been constructed within the rear of the body of the new sidecar offered by this firm. Two doors are provided, the lower one of which, when opened, is held in a horizontal position by means of two hinged brackets. On the inside of the door is a complete luncheön-box equipped for, two, persons. Two wooden brackets are hinged to the side of the box, which enables a false top to be opened to form a large table. The complete box may, if desired, be sid out on the rails fixed to the door. Also housed in the lower compartment are two collapsible seats. The upper locker is constructed to accommodate a two-gallon tin of petrol and a quart tin of oil, and should the sidecar be required for utility purposes, the luncheon box may be substituted by the passenger's luggage.

A very neat appearance has been obtained, the rear of the car possessing a gracefully curved line. A small tray is also provided in the nose of the body for the accommodation of pages or many.

of papers or maps.
The price of this sidecar when fitted with a special chassis, which is provided with coil spring shock absorbers, will be approximately £38

A LEVERLESS COM-PRESSION TAP.

A LEVERLESS compression tap of simple design has recently been placed on the market by Messrs. Leo Ripault and Co., King's Road, St. Pancras, London, N.W.1. Two components only are

The Ripault compression tap

used in its construction, one being the brass body provided with an hexagonal nut on the outside, the lower portion of which is threaded in order that it may be screwed into the cylinder. The other component consists of a brass screw provided with a circular adjusting head, serrated about its circumference for case of turning, in the centre of which

is a large priming cup. A hole is drilled through the centre of the screw to allow the petrol to flow from the priming cup through a hole in the tapered valve (located beneath the screw) to the engine. When the tap is in the closed position, the tapered valve is screwed on to the tapered seating inside the body insuch a way that no leaks may occur. This tap can be easily and readily detached for cleaning purposes.

OUR AMERICAN NEWS LETTER.

Some Notes of Sporing Events in the United States.

T the Passaic (N.J.) M.C.C.'s recent hill-climbing contest at Pompton Plains, the principal interest centred about the first competition between the Indian Scontread the Harley-Davidson sports model. The Harley-Davidson mediumweight, handled by a seventeen-years-old rider, who was compelled to carry a 25 lb. sack of sand to meet the minimum weight set by the M. and A.T.A., won with a climb of 703 feet. The Indian Scout went over the hill three times in practice, but in the hands of a novice rider, unfamiliar with both mount and hill, fumbled a good climb twice running near 550 feet up. The Scout has plenty of reserve power for gruelling work

in heavy sand. The hill is 800 feet long, The with a gradient of 1 in 3.

For the first, time in three contests the hill has been topped by sidecar outfits, both times by Indian riders. This event was watched with interest, because new rules of the M. and A.T.A. were being tried out. Formerly a sidecar passenger in hill-climbs was per-mitted to ride on the rear mudguard of the machine. No more, however, for the new regulation calls for the passenger to keep

in the car, from the hips down. The terrific drag of the sidecar wheel was overcome by the driver throwing his weight as far to the left (we use right-hand sidecars) as possible. This method held the two successful drivers to a straight course.

A Craze for Freak Hill-climbing.

With the running of the Passaic Club's climb, the "season" rounds out with no fewer than six big hill-climbs being promoted within a radius of one hundred miles of New York City. The craze for grade-conquering stunts does not abate, for everyone is talking of the 1920 climbs he will organise. Trouble is, we shall run out of hills if this activity keeps up. In fact, one ambitious set of promoters, keen for a real hill-climb, are planning to hold a contest up Mount Washington, in New Hampshire. This mountain is a part of the White Mountains of that State, and is a pimple of considerable size. Eight miles is the length of

the waggon road, and the top is 6,254 feet into the sky. This hill was the scene of a famed climb in 1905. An Indian rider made the eight miles in 20m. 59 s., or slower than the fastest automobile time.

High Speeds.

Since the F.A.M. passed out and the Motorcycle and Allied Trades Association Competition Committee assumed Amed Trades Association Competition Commence assume control of motor cycle competition, there has occurred a wonderful revival of interest in contests of all sorts. The controlling body put over four championship race meets in various parts of the United States, at all of which amazingly fast the controlling the controlling than the controllin parts of the United States, at all of which amazingly fast times were clocked by the timers. Foolishly or otherwise, "'Mattie'' officials did not attempt to affiliate with the Fédération Internationale des Clubs Motorcyclists, which deprives the Indian and Harley-Davidson machines of official world's records at various distances. At Sheeps-head Bay, on October 11th, 1919, two miles were ridden at an average a shade under ninety-seven miles per hour; and

at the same meet another mark was set for fifty miles at an average of 91 mp.h. At the next meeting of the F.I.C.M., American representatives from the M. and A.T.A. will be

Although road record riding has been brought to a stand-still in most parts of the States, on account of winter weather, Southern California continues to be the scene of weather, Southern California continues to be the scene of some fast riding. Boy Artley, riding a 1920 Indian, motor bolted in a rigid frame, shattered the San Francisco-Los Angeles mark by rolling the 465 miles in 9h. 25m., of October 31st, 1919. This clips his Henderson record by 39m., and breaks the Cadillac automobile time by 12m.

Artley averaged close to 50 m.p.h. for the journey. One stretch—the 221 miles between Frisco and Fresno—was ridden in 2h. 54m. which found out crears up to

widden in 3h. 54m., which, figured out, creeps up to 56 m.p.h. for four hours—almost unbelievable.

driving an Indian sidecar outfit, left New York City on a schedule that called for his appearance in Los Angeles, Cal., 3,327 miles away, just seven days and five hours later. He established a sidecar mark of 27h, 5m, for 802 miles when he pulled into Indianapolis for his first rest. West of that point, he encountered rains in country that has clay main roads. After many discouraging delays caused by miring into the mud deeply, Baker was forced to abandon his trial somewhere west of Kansas City, Kansas, or about halfway across.

The Indian Scout and Harley-Davidson flat twin in a climbing contest at Passaic, N.J.

American View of the Six Days.

At a time when we were turning to the A.C.U. Six Days Trial as a solution to our machine-wrecking endurance runs, that

nan winner, along comes news of a lot of dissatisfaction over the results of that same contest. From a seat 3,000 miles away, the affair looked like an illustration of that old saw, "Too many cooks spoil the broth." Inspections of motor cycles before and after a contest are fine ideas; but this one about silence, that lost the Harley-Davidson and Indian seven points or so, how was that arrived at? We always prided ourselves that, muffled down, both of those makes were rather quiet running.

E. B. Holton. rather quiet running.

There have been many efforts on the part of Australian motor cyclists to establish a record for the Inter-state route between Adelaide and Melbourne, and the Dunlop Rubber Co. between Adelaide and Melbourne, and the Duntop Rubber Co. has offered a trophy for the first rider to complete the journey in twenty-four hours. A South Australian rider, Mr. E. C. Wagener, recently made a piucky attempt to win this cup on a Harley-Davidson, and succeeded in covering the 589½ miles in 24h. 22m. The ride was checked by the officials of the motor cycle clubs of South Australia and Victoria, and, respectively the specific of the motor with the board of the product of cognising the merit of the ride, the Dunlop Co. awarded him a special trophy.

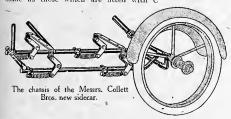

SIDECAR SUSPENSION BY COIL SPRINGS.

WING to the length of the average C spring used on the modern sidecar, there is always a tendency for the body to bonnee when the machine is driven sams passenger. With the idea of eliminating this, and also to provide a suspension system which will prevent side sway and canting, Messrs. Collett Bros., of I, Railway Buildings, South Norwood, have introduced a new sidecar embodying bell cranks aid coil springs in tension.

It will be seen from the illustrations that double crank levers are pivoted on the longitudinal members of the chassis, and carry on their upper arms the transverse plates which support the body. The lower arm of each pair of cranks is connected to one end of a coil spring which is fixed to the chassis. By this system the body occupies a position relative to the chassis approximately the same as those which are fitted with C

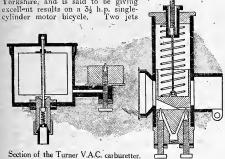

The suspension of the sidecar is by bell cranks and coil springs instead of ordinary leaf springs.

springs, and the direction and amount of movement are also similar. The design certainly has a clean appearance, and, provided that the bearings supporting the shafts of the bell cranks are of good size, are a good fit, and are kept lubricated, there is no reason why it should not be a great success. Some of the most comfortable sidecars we have used have been fitted with coil springs in tension, and there is a marked tendency at the present time for car designers to consider the many advantages obtaining with this type of spring for suspension purposes. With the Collett system it should be quite possible to include a means of adjusting the spring tension. Owing to the light weight of a sidecar, it is exceedingly difficult to provide springing ideal for both light and heavyweight passengers.

A SIMPLE AUTOMATIC CARBURETTER.

HE demand for carburetters operated by one lever only is steadily growing, and designs for this type are flowing in in large numbers. A very simple instrument, which depends for its automaticity on the shape of the throttle barrel and the size of its jets, has been produced by Mr. E. R. Turner, of Kildwick, Keighley, Yorkshire, and is said to be giving

are mounted in an extension of the float chamber, each being adjustable by means of a screwed taper needle. The jet nearest the engine acts as a pilot jet, and lies- in a groove in the throttle barrel, thus the incoming air is concentrated round the jet orifice. Delivery from the main jet is delayed until the throttle is about one-third open.

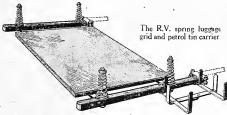

A curious feature is introduced in the float chamber, for the petrol orifice is normally closed by a spring-loaded ball, which is opened by the weight of the float and needle when the fuel in the float chamber sinks below the required level.

A SPRUNG SIDECAR LUGGAGE CARRIER.

UGGAGE platforms rigidly attached to unsprung sidecar chassis have almost disappeared from present-day sidecar designs. Current practice insists on the grid being spring supported, and this is done either by mounting the carrier on the body, where it has the benefit of the latter's springing, or else a separate spring arrangement is used.

On a rigid grid it is not only difficult to fix a luggage case to prevent it chafing the sidecar body, but the contents are sometimes damaged by vibration

A device readily adapted to standard sidecar chassis that brings the specification into conformity with modern ideas as regards the carrying of personal effects is manufactured by the R.V. Sidecar Co., of 92, Humber Avenue, Coventry. The platform, which is of enamelled wood, is

carried on four springs, supported in turn on two arms clamped to the main chassis tubes. Lightness of the whole construction is obtained by making these arms of ash, and they are stiffened by entirely surrounding them with steel flitch plates. A petrol can carrier is also fitted, and various modifications to suit different makers' chassis are undertaken.

Times to Light Lamps.

GREENWICH TIME.

Jan.	15th		 4.47	p.m
22	17th		 4.50	٠,,

Police Trap.

We have received indications on several occasions recently of considerable activity on the part of the Metropolitan police. There is a trap working between the Wheatsheaf, Banstead, and Banstead Downs.

Cubical Capacity Table.

A useful table, giving the cubical capacity of cylinders having bores from 50 to 90 mm. and strokes from 50 to 100 mm., is available from the offices of The Motor Cycle. The price is Is. post free.

Three-cylinder Radial Engines.

We are advised that the three-cylinder radial_engine fitted in the Beaumont motor cycle, which was described on page 46 of last week's issue of *The Motor Cycle*, is manufactured by a separate concern, and will be known as the Redrup.

An Anglo-American Alliance.

We are able to announce that Miss Marjorie Bridgeman, the daughter of Mr. E. A. Bridgeman, the well-known Indian expert, was married to Mr. Russell Reed Coes on the 3rd inst. Mr. Russell Coee, like his father-in-law, is a skilful rider, and took part in the London-Exeter run, gaining a gold medal on an Indian Scout motor cycle. He is an American subject, and has been over in this country for a holiday.

New Motor Fuel.

Reuter reports that successful tests of a motor fuel declared to be more economical, than petrol were announced recently in New York by Mr. Otto Praeger, Second Assistant Postmaster-General, in charge of the air mail service. The fuel consists of 38 parts alcohol, 30 petrol, 19 benzole, 7.5 ether, and 4 toluol. The ingredients making up the remaining 1½ parts were not given. It is stated that a saving of 3.9 gallons an hour in favour of the synthetic fuel was indicated in the test, for which two aeroplanes of identical design were used—one consuming petrol alone. While extremely interesting as showing efforts to develop what is termed a synthetic fuel, it must not be overlooked that the B.T.U. in such a mixture do not equal petrol. In view of the ingredients the term synthetic is perhaps hardly applicable.

Paris-Rouen Trial.

In view of the large number of competitions announced for this year, the Touring Moto Club of France will only organise one trial, namely, Paris-Rouen, which will take place on June 20th.

Air-cooling.

An interesting article on the future of aircooling appeared in last week's issue of our sister journal-The Autocar, in which the author states his conviction that in a very few years the air-cooled engine will become the standard motive power for touring vehicles. Most types of air-cooled engines are discussed.

A Story with a Moral.

At the London Bankruptcy Court, last week, a schoolmaster, who had filed his petition; stated that his failure was due to a motor cycle accident. Last July he knocked down and injured a woman, who, in an action against him, was awarded £500 and costs. In spite of previous warnings of a like nature, one frequently hears of motor cyclists who prefer to take third party risks themselves rather than pay for insurance.

French Scooter Trial.

The organisers of the French Scooter Trial, to be held on April 18th, have discovered that the maximum weight fixed by the Auto Cycle Union, and which they had adopted, will not allow many French manufacturers to take part; they have, therefore, increased the weight from 66 lb. to 88 lb. The height of the platform from the ground, also an A.C.U. regulation, is not sufficient for French roads, so the

Special Features.

STAINLESS STEEL FOR MOTOR CYCLES.

AIR COOLING UP TO DATE.

CHOOSING A TOURING SIDECAR

organisers have increased the platform height to eight inches. In making the announcement with regard to the alteration in platform height, English roads are referred to as billiard tables. Possibly, on the whole, our main roads are better than those of France, but they are not all "billiard tables."

123 m.p.g. with 3½ h.p. Motor Cycle.

To obtain 123 m.p.g. with a 3½ h.p. motor cycle during a reliability trial in Wales is indeed a good performance. This was achieved by Captain A. W. Brittain on a 3½ h.p. Sunbeam, fitted with a Binks carburetter, in the Liverpool M.C. Trial, last October. The average consumption of the six Sunbeam riders competing was 101 m.p.g.

Old-fashioned Road-making Methods.

The Fosseway, so far as the Leicestershire section is concerned, is a notorious stretch of road, which for some years has been neglected and is full of potholes. In an attempt to put matters right, the holes have been filled up with loose stones for a considerable dustance after passing the Syston lane-end, and considerable damage to tyres is now the result. The Notinghamshire section remains in excellent condition, and a spleudid object lesson to the road surveyors of the neighbouring county.

THREE STAGES IN THE WORLD OF WHEELS. A 6 h.p., a 23 h.p., and a one foot power mount starting out for a run in Kent!

We are informed on excellent authority that the revised taxation on motor vehicles will be based on cubical capacity of

Companies Registered from August to December, 1919.

The number of companies associated with the motor industry registered during the last six months was 411, the capital prescribed being £18,408,925.

The 1920 Tourist Trophy Races.

We know of a well-known private owner who is anxious to compete in one of the 1920 Tourist Trophy races. Any manufacturers who are interested and care to communicate with this gentleman should write to the Editor, who will be glad to place them in touch with him.

A reward of £10 will be paid by Mr. Boswell, Iver House, New Barnet, of information leading to the recovery of his 23 h.p. Douglas, which was stolen from the front of the Warrington Hotel, Maida Vale, on Sunday, January 4th. The machine was fitted with disc wheels, and bore the number LH 2987.

The Moulders' Strike.

Several of the leading motor cycle manufacturers are "closed down" owing to shortage of materials due to the moulders' strike. Apparently the majority of the moulders who are connected with the motor cycle and automobile industry are in favour of accepting the terms which have been effered to the affected trade.

59.8 m.p.g. with G.N.

The R.A.C. has now issued its "certificate of performance" in connection with Mr. Rex Mundy's non-stop engine run from London to Edinburgh on N.B.A. benzole. It certifies that the engine was not stopped nor the clutch disengaged when descending hills. The oil consumption was 316.4 m.p.g., the benzole consumption being 59.8 m.p.g.—equivalent to 42.6 ton-miles per gallon. The total running weight of the runabout with passengers was 1,594 lb. (approxiwith passengers was 1.594 lb. (approximately 14 cwt.), the weight of the car being 1,246 lb. (approximately 11 cwt.). The equipment included a Sthenos type B.H. carburetter, Cooke plugs, Easting car screen, and Palmer 700×75 mm. tyres. Coolie oil was used.

Motor Permits for Ireland.

In conjunction with the Irish authorities, and working through the Royal Irish Automobile Club, arrangements have been made whereby members and associate members of the R.A.C., who wish to proceed to Ireland with their cars, can obtain the requisite permits beforehand. The details required by the authorities are:

(1.) Dertyen.—Surname; Christian names; pro-lession or occupation; age; height; build; colour of hair; name and address of the owner of the car; registration number; make, horse-power, relour, and seating accommodation of car; two small photographs, unmounted (of driver), 3in.x 24jin.

22-in.

(2.) OWNER.—Surname; Christian names; pro-lession or occupation; address; recitration number of the car; make, horse-power, colour, and seating accommodation of car.

(3.) If the owner of the car wisbes to drive it he must supply precisely the information concern-ing himsell as requested for the driver.

Second-hand Prices.

High prices for second-hand machines are likely to prevail this spring on account of the lack of new machines resulting from the moulders' strike, which has suspended manufacture for about three months.

Alcohol as Fuel.

There is every possibility of a test being made in the near future of a British motor spirit that has alcohol as its base. The trial will probably be conducted on the lines of the recent 5,000-mile National benzole test, and a driver with much experience in this class of work has already been retailed. Extremely low cost will be a feature of the new fuel, but it remains to be seen whether the lower thermal value of alcohol will commend itself to motor cyclists with lowpowered engines in competition with petrol and benzole.

IMPORTANT DATES.

Sat. Jan 17th, to "a", Jan. 24th -Montreal Motor Show.

Fri., Jan. 23r J, to S t., Jan 31st - Scottish Motor Show, Glasgow.

Thurs., Jan. 29th-Institution of Automobile Engineers. Taper by Dr. A. H. Gibson on "Air-cooling of Engines," hamber of Commerce, Birmingham, 7 30 pm.

Fri , Feb. 13th, to Mon , Feb 6th-Paris-Nice Trial

Mon, Feb. 23rd, to Sat. March 6th-British Industries Exhibition, 1 irmingham Sat. Feb. 28th— Sutten Coldf eld A.C Trial for Colmore Cup

The T.T. in Danger.

If the moulders' strike is not settled soon, it is extremely doubtful whether manufacturers will be able to build their special machines for the T.T. races.

Considerable interest is being manifested in the 250 c.c. class for the Junior T.T., which will compete for *The Motor Cycle* trophy. As was to be expected, our suggestion to encourage the development of the smaller machines promises to swell the entries for the Junior race, as there are quite a number of makers interested in engines under 250 c.c., who would not otherwise bave entered in direct competition with engines 100 c.c. larger. Nevertheless, should a particularly fast 250 c.c. machine be produced, it may have a chance to win both trophies, i.c., the Junior T.T. and The Motor Cycle Cup.

New South Wates TT

Messrs, John Marston, Ltd., have been advised by cable that the New South Wales Tourist Trophy has been won on a 3½ h.p. Sunbeam.

Ilford Bridge.

The R.A.C. warns motorists that great care is required in crossing Hord Bridge. The surface of the road in this locality is particularly bad.

Evesham.

The pelice at Evesham do not allow motor vehicles to stand in Bridge Street, and motor cyclists desiring to stop in the old town are advised either to garage their machines or leave them in High Street or Market Place.

Entrant for Paris-Nice Triat.

Among the several British entrants for Annuag the several brish entraits for the Paris-Nice Trial is Mr. Maurice Greenwood, who is riding the machine he entered for the F.I.C.M. Six Days Trial at Grenoble in 1914—a 2½ h.p. twostroke Connaught.

French Trial and Beach Races.

The Moto Club Parisien will hold a trial for motor cycles and sidecars from Paris to La Baule and back on May 2nd. A speed trial in conjunction with the reliability test will take place on the beach at La Baule

Police Tran

We have received information of a police trap working on Saturdays and Sundays chiefly, on the main Croydon Road between the Anerley Road and the Mitre Hotel. The road is absolutely straight and down hill, and is therefore an inducement for a good turn of speed.

Another Trial in France.

The Moto Club of Marseilles will held a touring reliability trial from Marseilles to Nice and Monte Carlo on April 4th. There will be twelve classes and numerous prizes. Entry forms and further particulars can be obtained from the secretary of the Marseilles M.C., Brasserie du Chapitre, Marseilles.

One Car Every 25 Seconds.

In a paper read before the technical section of the Institution of Automobile Engineers, on the 7th inst., Mr. A. Tilt, the author, stated that the Ford factory, in addition to the skilled men, employs the "scum of the earth," represented by fifty-two nationalities, speaking 100 dialects, working in soulless monotony. The result is a complete chassis every twenty-five seconds.

Re-making Belgian Roads.

The Royal Automobile Club has received information from the Belgium Ministry of Public Works that it has decided to commence a vast programme of road improvements which will prove a real boon to motorists who may wish to tour in Belgium. The programme includes the remaking of a network of roads which will connect Brussels with all important towns and centres, and will afford communication by means of good cross-country roads between various tourist resorts, the devastated districts, and the battlefields of Flanders.

South Birmingham M.C.C.

The final results regarding the Palmer Cup Trial, held last autumn, have now been announced as under:

B. Bird (41/4 B.S.A.), Palmer Cup and Cameta

Cup.
G. Kuhn (Levis), Upton Cup.
A. Walker (4 Triumph), Cooper Cup.
A. Milner (Diamond), gold medal.

The Brookdale Club.

The Brookdale Club (Catford), Ltd., has just completed the purchase of the freehold of its headquarters at the Brookdale Hall, Catford. It will be carried on as a sports and social chab, and prior to the war was making great progress with its motoring section.

The New Bedford Club.

A large number of applications for membership have been received for the proposed new club in the Bedford district, and a meeting will shortly be held in one of the central hotels in Bedford to elect officers. All local riders who are interested should send their names to either Mr. C. F. Plowman, 37, Broadwater Avenue, Letchworth, Herts, or Mr. H. H. Berrie, Goldington, Beds.

Bath and West of England M.C.

The above club is holding a twentyfour-hour reliability trial from Bath to Land's End and back on the 23rd and 25th inst., which will be confined to members only. The entrance fee is 7s. 6d. Motor cyclists wishing to join the club and desirous of competing in the trial should communicate with the secretary, Mr. C. B. Newman, 20, Stali Street, Bath.

Ealing and District M.C.C.

The annual dinner of the Ealing and District M.C.C. will be held at the Clarendon Restaurant, Broadway, Hammersmith, on March 2nd, at 8 p.m. Prizes won during the 1919 season will be awarded. Motor cycling events, filmed by the Hon. Victor Bruce, will be shown on the screen during the evening, and a concert has been arranged. The price of tickets is 10s. 6d., application for which should be made immediately to the hon, sec.
An interesting non-competitive

is fixed for February 1st. This will be in the nature of a run under Colonial conditions as regards road surface and course. The run will start from Kew Bridge at 10 a.m., and the Colonial section will be entered at Horsley Towers, near East Horsley, at 11 a.m.

Those desirous of riding, but who are not members of the club, should apply for particulars of membership to the hon. sec., Mr. S. P. L. Brown, 25, Ormiston

Road, W.12.

East Midland Open Events.

A meeting of representatives of the affiliated clubs in the enlarged East Midland District was held on Saturday evening at the Angel Hotel, Sheffield. Considering the size of the area, the meeting was splendidly representative, delegates attending from Loughborough, delegates attending troin Louginourous, Nottingham, Ilkeston, North Derbyshire, Sheffield, Lincoln, Wath on Dearne, Ilkley, York, and Derby N.F.U. The business, mainly, was to discuss the arrangements for the running of the three open trials allotted by the A.C.U. at the meeting at Olympia. A discussion took place respecting the arrangements made in London. Mr. Myhill, of Ilkeston, considered that, as the largest number of clubs were situated in the southern part of the area, one of the two dates allotted to the northern clubs should be transferred. The arrangements made in London respecting the York and Ilkley clubs were confirmed. It was resolved to allow all other than the York and likely clubs to participate in the organising of the remaining fixture (a speed event). North Derbyshire was

deputed to find and submit a suitable course, the Lincoln club to have the second option. All clubs joining in the organisation of the event to share profits or losses in ratio to their club member ship. It was resolved that the East, Midland Centre Challenge Trophy be competed for in the three open events. three teams of three riders from each club competing for reliability at the Ilkley trial, hill-climbing at the York trial, and speed at the North Derbyshire or Lincoln event. The cup holders, North or Lincoln event. The cup holders, North Derbyshire M.C.C., proposed that new clubs joining up pay an entrance fee of £2 2s., this, as in the past, to cover all entrance fees for all future trials. The proposition was agreed to. It was pointed out that at previous trials the inclusion of the Trophy had ensured the success of the meeting, Doncaster in 1914 having what was probably the largest gate for any event held outside Brooklands. Mr. J. Simmonds, Nottingham and District M.C.C., was elected as the centre representative on the General Committee of the A.C.U. The hospitality of the Sheffield club in providing a substantial tea was much appreciated.

Wanted, a Club for Mansfield.

Mr. G. Mills, 16, Hall Street, Mans field, will be pleased to hear of motor cyclists who would be willing to help in organising a motor cycle club for the district.

A Club for Finchley?

Mr. Bernard Staley Burnage, Victora Avenue, Finchley, N.3, proposes to form a motor cycle club in his district, and asks fellow enthusiasts to communicate with him with a view to forming a com-mittee to discuss the matter.

N.M.C.F.U. (Sheffield).

A meeting in connection with the above will be held in the Y.M.C.A. Boys' Club Room, Talbot Lane School, Rotherham, on Saturday, the 17th inst., to commence 6 p.m. As a result of this meeting it is hoped to form a branch of the N.M.C.F.U. in Rotherham, and all members and other motor cyclists in the district are invited to attend.

Bargoed and District M.C.

A meeting was held at the A1 Re-staurant, Bargoed, on Tuesday of last week, when it was unanimously decided to form the above club. Great interest was manifested by those present, and about eighteen members were enrolled.
The opening run has not yet been arranged, but meetings will be held every Tuesday, at 7.30 p.m., till further notice. All interested are asked to communicate with the secretary, Mr. W. H. Merchant, 60, Park Place, Gilfach, Bargoed.

A Test of an Air-cooling Device.

A Road Test of Mr. Hawley Morgan's Exhaust Cooled Motor Cycle Engine,

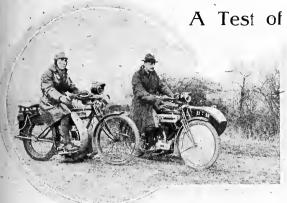

missing the gear, but the machine was immediately taken to the bottom and restarted, the hill being climbed without a falter. A second attempt by out the inventor was entirely successful, and through-out the run the engine showed no signs of dis-tress. The third attempt was made to climb the hill with the Triumph's passenger on the back carrier. The engine, however, was not sufficiently powerful to take the gradient, but it came to a standstill on the steepest portion, half way up the hill, without signs of knocking.

The return journey was also made at a good speed, and certainly it seemed impossible to make the little engine fitted with the cooling device overheat, but it was so extremely cold (a strong north-east wind was blowing) that we should have been more satisfied had the test taken place in really hot weather.

Our readers will remember that Mr. Hawley

Morgan's idea is to surround the cylinder by means of a special jacket in which vertical slots are cut, and to introduce a forced draught by means of an ejectorincorporated in the exhaust system, causing the air to be drawn through the slots in the cylinder fins.

It is very difficult to form a conclusive opinion of a device of this kind in a short run, and a more extended trial is really necessary. A long trial over difficult country and under varying temperatures would be far better. We can say, however, that during the brief test to which we put the machine the system behaved satisfactorily, and the idea is really well carried out. Our photographs will show the excellent protection afforded the rider's legs, but as the day was dry the efficacy of the mudguarding could not be adequately tested.

The 23 h.p. New Imperial fitted with the device, and the Triumph sidecar which followed the test.

N the issue of December 18th we described an ingenious cooling system invented by Mr. Hawley Morgan, and during a recent week-end we took the 23 h.p. New during a recent week-end we took the 23 h.p. New Imperial equipped with his invention for a run of about thirty miles Leading the way on a 4 h.p. Triumph and sidecar, we set the pace to a speed which kept the little solo machine hard put to it, and after covering about five miles a sharp turn to the right was taken up a fairly steep hill. The little engine took the gradient on about quarter throttle, and shortly after that we took it over ourselves and drove it for a further five miles, and then, without the steep went trained to a solon the first transfer and the second was the second with the second was the seco stopping to cool, went straight up a gradient of 1 in 5 on the slopes of the Chilterns. Unfortunately, on the first attempt the machine was brought to a standstill through

Mr. Hawley Morgan making a good ascent of Chaul End Hill near Dunstable.

AUTO CYCLE UNION NOTES.

HE thirteenth annual dinner of the Auto Cycle Union will take place in the Great Gallery of the Royal Automobile Club on Wednesday, January 21st. The Hon. Sir Arthur Stanley, President of the Union, will take the chair. The reception will be at 6.15 p.m. for dimer at 6.45 p.m. Tickets, price 15s. each, may be obtained of the Secretary, A.C.U., 83, Pall Mall, S.W.I.

Paris=Nice Trial, 1920.

The Auto Cycle Union is making every arrangement to facilitate the convenience of members attending or compet-

ing in the trial. The requirements of the French anthorities in regard to Customs formalities are being met in the most expeditious manner, and A.C.U. members will be able to obtain triptychs and other documents which will eliminate several inconveniences to which they would otherwise be subjected.

Intending competitors are reminded that petrol and lubricating oil may not be taken across the Channel with their machines, but the leading firms marketing these commodities have taken steps to ensure a ready supply in

30,000 Miles on a Two-stroke.

The Lightweight Mctor Cycle for Long Distance Utility Work.

SINCE the days when there first appeared on the market the lightweight motor cycle, there seems to have been somewhat of a doubt as to its possibility for really hard and constant work. Even now it is looked on in many quarters as a mere handy

runabout for short journeys and pottering. That the contrary is the truth does not yet seem to strike many, and the experiences I give below may bring home to them how very much can be done with such a machine. In fact, given a good model, it is the equal in all respects to its big brother (bar one thing, namely, for sidecar work), and it has an extra advantage that many riders of big horse-power and heavyweight machines do not recognise, viz., exceptional handiness for storage and convenience on the road.

The writer some four years ago, being very much struck by an article by "Ixion" in The Motor Cycle, bought his first lightweight, taking it as merely an adjunct to a heavy sidecar outfit, which was then doing all his work. At first it was used merely for the purpose that the makers nominally gave as its reason for existence, i.e., short journeys and general handiness for pottering about. For a year the machine was used for such purposes, and was actually sold with the idea that it was not meant for serious and heavy work.

Ligh weights for Business Purposes.

Three years ago, however, having to make a lot of business calls to farms and cottages in a country district, and finding the heavier machine had disadvantages in that direction, I invested in a new Triumph Baby, and the work on which it has been used for 30,000 miles has been to all intents and purposes that of a hard-driven commercial traveller. Day in and day out, in all sorts of weather, through mud, over good, bad, and indifferent roads, over grass tracks on the Sussex Downs, hilly country and plain, the machine has been given every chance of failure.

For three years this little machine has been on the road, it has been taken out and run with no regard to speed, often when in the company of one of the motor cycle riders of a big London daily, and it has been kept hard at work at over thirty miles an hour for hours on end. It has not been merely a question of short journeys, for often it has been on the road-from early morning till late at night. For two years it was used for extra heavy work by a despatch rider of special constabulary, over rough rutty farm tracks, over grass tracks, climbing hills of r in 10 and 1 in 13, etc., over roads full of pot-holes, and over roughly laid country roads full of loose stones.

The Junior Triumph used by the writer on constabulary duties.

It has proved handy in a way that few realise. One can store it in a passage and take it up and down steps quite easily. For constant stopping and starting it has no equal in the big machine, for I have never yet in all this big mileage failed just to get astride it, and walk a few paces and off, on the journey.

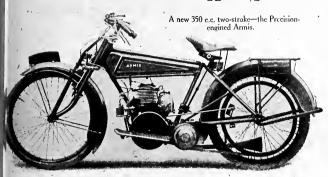

Its running cost has been exceptionally small: an average of ninety-five miles to the gallon for petrol. Very little cost for lubricating oil, one new Dunlop belt, one new set of Dunlop tyres, and one new wire for a brake, are, I find, from my carefully kept cost records, the total expenses for the fine total of 30,000 miles. I find it, too, an exceptionally clean machine to ride. I often go out in my ordinary walking clothes, with a heavy black overcoat as outer costume, and never yet have I had anyone comment on my appearance when I call. Of course, on wet journeys a complete set of oilskins has been used, and I can arrive at the end of a journey, take them off and turn in to my call as clean and tidy as if I had made the journey by train.

Those who are considering the employment of motor cycles for their work should think seriously of the lightweight. Such a machine should be kept clean. Ten minutes' attention on arrival home on a dusty day, and twenty on a wet day, have been enough to keep my machine in good condition. The bearings should be lubricated regularly, and the bright parts vaselined once every month in winter or wet weather. Good sparking plugs are essential. I have used two Lodge plugs only: the last one, an Aero plug, which is very efficient in this engine.

Minimum Attention Necessary,

Finally, it must be remembered that, to obtain satisfaction, the lightweight—or any motor cycle, for that matter—should be kept in trim., Oil and reason must be used. No man spends fifty pounds on a horse, and then leaves it in a shed at night without any attention. If he does, he soon has a dead horse. I have ridden and experimented for pleasure and profit since the first motor cycles were put upon the road; and, though I still cling to the sidecar outfit as the best fun in the line, I think that the lightweight is a serious—aye, a very serious—proposition to be considered when we are all looking at the question of motor cycle utility.

R. C. Measures.

A NEW 350 c.c. TWO-STROKE

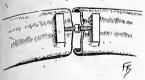

WHEN Messrs. F. E. Baker introduced their new 350 c.c two-stroke engine unit, we expected that it ould attract newcomers to the so-called otor cycle assembling field. The Armis ycle Manufacturing Co., of Heneage treet, Birmingham, is one of these, and the Armis motor cycle is the result. It. a new name so far as motor cycles te concerned, but they men behind it is not new to the motor cycle industry, or Messrs. Harrison and Baker, the rincipals, have long been associated with te Calthorpe Motor Cycle Co.

Having a straight tube frame with iagonal top tube, the machine follows ore or less conventional lines with good undguarding and aluminium foothoards. he forks are of the Saxon type.

The saddle suspension is rather unique, at consists of a laminated leaf spring lipped to the rear tube of the frame in a approximately parallel position. At supper end the saddle is fixed, so that he weight of the rider is carried on the pring in addition to the usual pair of oil springs

A DETACHABLE RIM FOR MOTOR CYCLES:

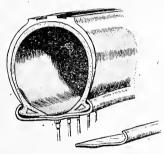

THE fertile brain of Dr. A. M. Low has been responsible for two more inventions in connection with motors. One of these is a detachable rim or high-powered motor cycles which are ow fitted with light car tyres.

The joint of the Low detachable rim.

Referring to the drawings it will be een that one part of the rim carries he spokes. The detachable portion is half-split rim, so that by unscrewing toggle, shown in the small illustraion, situated at the end of the letachable portion, the rim 'can be extended, and thus half the rim can be lifted out of the recess carrying the spokes and entirely removed, allowing the tyre to be slipped off without any trouble. It is probable that the device will be marketed by Rapid Rims, Ltd., 7, Pall Mall, London, S.W.I.

Dr. Low is also responsible for a simple and practical form of petrol tap which is quite suitable for use on motor

Construction of the Low detachable rim.

cycles. The tap consists of a brass casting, into which the top is screwed by means of a peg spanner. In the top there is threaded a small rod to which the lever or tap handle is fitted. When

the handle is screwed down, it forces a steel disc on to the petrol orifice, and a perfect joint is secured. It is difficult to see how any petrol leakage can occur in a tap of this kind, whether open or shut, if the unions are tight, as it is simplicity itself. If necessary, the disc may be welded to the top portion of

A petrol tap of new design.

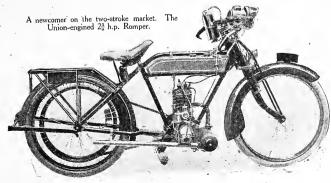

THE ROMPER MOTOR BICYCLE.

A NEW lightweight has been placed on the market which is known as the Romper. It is fitted with a 2½ h.p. Union two-stroke engine, equipped with an Amac carburetter and Rumbaken magneto.

The frame is of somewhat interesting design, as the engine is placed exactly in the centre, with a view to giving a perfect balance to the machine. Special attention has been given to the construction, the head being reinforced, and incorporating lugs for the top tube and the anxiliary tube, it is consequently very strong. The back forks are detachable, and the portion forward of the rear mudguard is designed so that a two-speed gear box can be fitted without difficulty. The machine, as sold, is of the single gear pattern. The back lug casting is similar to that of the head, the same casting having lugs for the top tube and the auxiliary trame tabe.

the auxiliary frame tube.

An unusual fitting is a long brass pipe which is carried underneath the tank for the purpose of conveying acetylene gas from the generator to the rear lamp, thus doing away with the unsightly appearance of loose rubber tubing. Excepting that it has a short wheelbase, standard lines are followed for the remainder of the machine. It has 26 × 2in. wheels, taking 24in. tyres, wide, comfortable saddle, Bowden front brake, and a pedal applied rear brake engaging with the belt rim.

The Editor does not hold himself responsible for the opinions of his correspondents. All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

RIDING AT NIGHT.

Sir,-If "J.M.," who wrote about "Riding at Night" in your issue of December 18th, will procure the coiled wine covering of a Bowden cable (Bowden solo) and slip over it an Exonite casing, he will obtain the gastight, flexible, unpinchable, and inconspicuous connection tube he requires for his rear light.

J. C. BENNETT MITCHELL.

FIREWORKS FROM MAGNETO

. Sir,-Some little time back a correspondent in your columns wrote of a firework display from his magneto. I have had a similar experience. On a recent wet Saturday nave and a similar experience. On a recent voet Saturday afternoon I stopped to give another rider a push off, and on running my own 'bus [2] twin Enfield) the magneto terminal sent out a shower of sparks, about 8in. in length and feather sent out a shower of sparks, about out in league and sensitive shaped. I immediately stopped and removed the terminal, wiped it dry, and replaced it. The sparks did not recur again, and the bus went as well as ever. Can any reader explain this? Birkenhead.

T.T. RACES AND THE 1.0.M

Sir,-In view of the large number of motor cyclists who will be visiting the I.O.M. for the T.T. Races, there is a will be visiting the LOAN. for the LL Races, there is a very vexatious and unnecessary regulation which all motor cyclists and car owners have to comply with and, I am sure, would like to see abolished, viz., all motor cycless and car owners must register themselves and motor cycle within twenty-four hours of landing, and if they reside on the island over one month they have to go to the expense and trouble of taking a Manx registration out.

As this unnecessary regulation is not in force in any other part of the United Kingdom, I should like to see this letter published in *The Motor Cycle*, and brought to the notice of the R.A.C., A.A., and A.C.U. with a view to the above vexatious and unnecessary regulation being abolished.

Liverpool.

CLUTCHES ON LIGHTWEIGHTS ..

Sir,-An examination of the latest specifications shows an increased tendency amongst makers to incorporate clutches in lightweight machines. This prompts me to ask—"Is a clutch really necessary on a lightweight motor cycle, and do the advantages which accrue justify the extra expense?"

On several occasions recently here in Edinburgh I have seen motor cyclists held up by the policeman regulating the traffic at the west end of Princes Street. Those cyclists having clutch machines declutched, and kept their engines having clutch machines declutched, and kept their engines ticking over, whilst their clutches brethren stopped their engines. When permitted to proceed, the latter got away quite as quickly as the former, merely by pushing off with their feet, particularly those possessing a certain 23 h.p. flat twin. This machine is extremely popular in this district, and I notice that all the 1920 models are fitted with

Personally, I never considered a clutch necessary on lightweight machines; my first mount was a 1910 24 h.p.

Correspondents are urged to express themselves as concisely as possible, especially in view of the fact that only a small percentage of letters received can possibly be published. Many interesting letters are unavoidably omitted in consequence of their abnormal length.

Motosacoche, and I scrapped the jockey pulley clutch arrangement on this excellent little machine immediately on

taking delivery.
I also notice from recent correspondence in The Motor Cycle that some readers experience difficulty in starting big

single engines from cold.

single engines from cold.

I have at present a B.S.A. combination, which never gives me any trouble in starting. I give the jet about three-quarters of a turn, open the throttle about one-third, and the air just a trifle. I then put the machine into first, and push off. About two yards usually suffice. In very cold weather a few drops of fuel through the compression tap help considerably. I always use equal parts of petrol and benzole.

DAVID W. MUNRO.

A SUBSTITUTE FOR PLATINUM.

Sir,-Perhaps some of your readers would like to hear of a new substance instead of platinum for magneto points. a new substance instead of platinum for magneto points.

I have a Ruthardt magneto, and, through running without a carbon, I burnt the points out and for a new pair at a magneto agent's I was quoted [22, 64]. Der point, a price which I thought too high. Anyway, I went home without the points, but with the expectation of inventing something not so dear as platinum. To begin, I ground all the odd bits of platinum from the spring and screw, and cut out two small pieces of pure nicket, which I soldered on instead of the platinum. After some time of solid hard wear I examined the points and found them prefect, not even examined the points, and found them perfect, not even burnt, notwithstanding I am running without a carbon, might add that the cost of these points would not be one-tenth the cost of platinum points. Perhaps some of your readers will likewise try this, and let us know the results. Belfast.

THE A.C.U. REPORT.

Sir,-May I be permitted to reply to "Lightweight's" one would gather that "Lightweight's" ideal motor cycle is the Henderson, plus another seventy or eighty pounds of water jacket, radiator, and water, bringing the weight right up to approximately 400 lb. solo.

Right here I would hasten to add that I do not go all the way with Mr. Norton, who, of course, is the champion of the "big single," although I ride one myself.

It is well known that the ratio weight horse-power decreases as the number of cylinders increase, and I fancy that motor cycle design will tend to follow this line, a thing supported by the greatly increased popularity of the h.o. twin.

We may or may not get the aeroplane type of engine on the motor cycle. One thing I am certain of, and that is that the motor cycle. One thing I am certain or, and that is water cooling will never enjoy any very great popularity amongst motor cyclists. More, I venture to prophesy that it will eventually die out, even amongst heavy cars. The air-

will eventually die out, even amongst heavy cars. The arcooled cycle car has been with us a long time, and no one would venture to say that the Morgan, for instance, would not comply with "Lightweight's" definition of utility. Anyway, the big single is not dead yet. I have yet to be shown a multi-cylinder bus that will put up with the "brutalising" that mine has suffered and still go anywhere on a 4 to 1 gear fixed engine. When I can, I shall welcome it with open arms, provided that it is light for the power developed. developed.

rmanent for all vehicles.

I know what the unlighted WILBERFORCE DURELL permanent for all vehicles. cyclist is to my cost.

IOW MOTOR CYCLES ARE STOLEN.

Sir,-I regret to say that the machine I recently adverised was stolen by means of the following trick, and if you could give this publicity it might prevent any other adver-

iser being victimised in the same manner.

The thief, a pleasant, well-dressed man, age about 27, reight 5ft. 8in., hair light brown, eyes blue-grey, clean haven, called during the morning, stating that he was a hauffeur, and unable to call after six, as requested in dvertisement, and obtained my business address from my ister. He then called on me, informing me he had seen ay machine, etc., and asked for an appointment that even-ng, and after leaving me seut a forged wire, in my name, o my mother, stating I had seen "Taylor," as he called umself, and might let him try the machine that afternoon, which, unfortunately, she did.

As the affair was apparently carefully planned, it is not unlikely that the trick may be tried again.

J.W.B. Leytonstone.

INBUSINESSLIKE METHODS.

Sir,-I think the following, as an example of post-war business" methods, might be of interest to your readers. From a firm which has a world-wide reputation for highlass motor cycle lighting accessories I ordered an electric lead lamp, after which the sequence of events was thus:

November 6th.—Receipted invoice received.

November 7th.—Lamp received, tested, and lamp holder unit found to be faulty. Lamp holder returned same day,

with request to rectify fault as soon as possible.

November 20th.—"Hurry up" letter sent, having had neeply to my letter of the 7th, and requiring lamp urgently.

November 30th.—Still no reply, so wrote again.

December 10th.—No reply to any of my letters, so handed opies of correspondence to the Automobile Association.

December 12th.—Lamp holder received. No letter.

December 15th.—Letter from A.A. saying lamp holder was using despatched on the 11th inst. Also letter from makers dated 10th), saying holder was being posted "to-night." Vo mention of an apology for non-reply to my letters.

Needless to say, that firm has booked its last order from ne or any of my friends.

I should like to add my testimony to that of the many . others who have found membership of the A.A. a "very present help in trouble." SYDNEY R. ELLIOTT.

CE ON THE ROADS.

Sir,—I should like to give a word of warning to night iders of the condition of the roads at this time of the year.

On returning from Kendal the other night, rather late, or the first ten miles the roads were in quite good condition—in places, perhaps, rather muddy. Without any warning I came upon a stretch of ice, and did two complete spine sefore finally settling down. I had to drag the machine to the side of the road before I could get it on to its wheels igain. After riding in the gutter for a couple of miles, he road apparently became better, so I ventured into the middle of the road, Feeling more confident, I opened out a little, perhaps 15 m.p.h. A policeman, standing at the side of the road, never gave me any warning. Soon ifter I passed him I came upon another stretch. I did one complete spin, and finished with a somersault.

With the policeman's assistance, I got going again. I did not encounter any more ice-in fact, mud was the rule

for the remaining part of the journey.

My machine, an 8 h.p. Zenith, was very slightly injured, due, I suppose, to the weight being carried low and the machine being so strongly built.

J.L.W. Lancaster.

SCOOTERS.

Sin.—I think that if scooters are to become popular they should be cheaper. Just on £50 is too much for these diminutives, It is nearly £10 more than the lightweight that aspires to become the two-wheeled Ford. If they are to appeal to women they must be both simple and cheap. With a valveless engine, one lever carburetter and simple transmission, satisfaction (in starting, upkeep, etc.) is assured to the biggest duffer (mechanically), whether he or she. Mr. Frank Whitworth seems against the "no seat" she. Mr. Frank Whitworth seems against the "no seat" didea. Scooters are generally given a seat to hide the defect of wheels and footboard not being sprung. Another reason for a seat is to use it for a wrong purpose (for long journeys

instead of short trips). The word "scooter" should apply instead of snort trips). The word "scooter" should apply only to those ultra simple seatless machines with whicels up to 16in. Some of the machines now masquerading as scooters are really poor initiations of the Phenix Cob, an open-frame machine, made by Mr. Van Hooydonk seventeen years ago, for elderly riders. Mr. Whitworth has evidently been no seatled seatled to the control of the property of the control done no practical experimenting with scooters, or he would not question the comfort of 10in, wheels, referred to by Major Kennedy. Years ago I made a motor skate with 8in. wheels which was comfortable at ten miles an hour (even with cushion tyres). Any size wheel has its safe speed. 1 think a reliable scooter could easily be made to sell at £35.

Lewisham, S.E. STANOOP.

AN INVALID MOTOR CHAIR.

Sir.—No donbt the invalid motor chair which your correspondent, Jas. Cooper, saw in the Hammersmith Road during the Motor Cycle Show was one of our production, and the one on which our Mr. Garnett, himself an invalid, which the Show on saventh or savent visited the Show on several occasions.

The "Argson" three-speed hand tricycle with Auto-wheel attached.

The chair itself was one of our three-speed gear-driven models, with an Auto-wheel attached, and, as the latter can be removed or replaced in less than five minutes, Mr. Garnett was able to proceed to the Exhibition under power, and, on arriving there, detach the wheel, and "paddle" around the Show by hand.

A speed of anything from 3 to 25 m.p.h. can be main-

tained, and the machine is perfectly steady on the road, and easy to steer and control.

THE ARGSON ENGINEERING CO., LTD.
S. O. NEEDHAM, Director.

SPEEDING-UP THE TRAFFIC

Sir,-In view of the tremendous increase of all motor traffic, an increase which will probably double and treble training an increase which was proceeding to the laws relating to traffic control were thoroughly overhauled?

Obviously the ridiculous twenty mile limit should go-driving to the danger of the public would cover all cases of

road-hogging.

The unwritten law of main road precedence should be made actual law. I would suggest going one further, and having three grades of roads, the higher grade always to have undisputed right of way over the lower. Roads are already classified in this way in most maps, and a standard map could be used as a basis for argument until all entrances to higher grade roads could be marked by sign-posts. Once the public was accustomed to this, an average main road speed of 35 to 50 m.p.h. could be maintained with as much safety as the present-day twenty.

A speeding-up of all forms of transit is the natural form of evolution, and should be catered for rather than hindered. Why, in the name of fortune, should blatant signs order the whole mighty stream of traffic of a great main road to pull up because a carter occasionally drives out of a farm, entrance, or a munitionaire out of his lodge gates?

Granted, the said carter and munitionaire would need much education before speeds previously mentioned would be reasonably safe, but time and fines for breaking such a law would do even that.

In any case, the onus of avoiding accidents is put definitely on to the few for the benefit of the many, which is surely the essence of just law.

Your readers' opinions on this subject would be interesting if you could find room to insert this in your valuable paper. GET A MOVE ON.

Luton.

SIDECAR HUBS

Sir,-This is probably an old complaint, but worth ventilating again. Cannot something be done to persuade manufacturers of sidecars to fit wheels to their chassis which can stand up to the heavy strain imposed upon them? The hubs of most of the wheels are altogether on too small a scale, both cones and balls being undersized, besides the design being unsuitable for a wheel that is liable to severe side strains. Should not all sidecar wheel spindles be supported at both ends, at least for high-powered machines? I have recently been endeavouring to obtain a sidecar chassis for a new heavy 8 h.p. machine, and have tried many firms in and around London, none of whom are in a position to give immediate delivery of what I require, but all offer various makes of chassis with same unsuitable wheel. When I complain that the wheel is of a size totally inadequate for the work they all admit that it is so, but say that customers prefer a cheap model rather than pay a few extra shillings for a good article. This may or may not be true, but it is surely up to the trade to advise their customers as to what design of chassis is suitable to their requirements, rather than to sell an article which they know cannot give anything but trouble. Is it because the manufacture of hubs is practically the monopoly of firms who probably have no experience of motor cycles and sidecars on the road? It is certainly time that motor cyclists could feel that the reliability of an outfit will not be jeopardised by the failure of the cups or cones of their sidecar wheels. One has only to compare the sidecars made by or to the design of motor cycle manufacturers and those made by many firms who specialise in sidecars only. I am. aware that there are one or two sidecar manufacturers who are above reproach, but, judging from what one sees on the road, they are few and far between. STANDARD. London

AN IMPROVEMENT IN AIR COOLING

Sir,-Regarding powerful two-strokes, I think they will serve the rider well if under-driven, i.e., not driven all

out for any considerable distance, that is, as they are constructed at present. . I used one with a light sidecar for about four years, a 318 c.c. belt-driven, three-speed hub, kick starter machine. Passenger ten stone, rider ten stone. Longest run without any stop, forty-six miles, out any stop, lorty-sia miles, and then only on account of arriving at destination. I found it a good climber and comfortable to drive, but it wore out three or four belts during the time I had it. I found the three-point plug the best.

122520112465 January at 1941 THE PERSON AND THE P A suggested improvement in

air-cooling. (See letter from "Rider.")

I like the idea of a cooling jacket by Mr. Hawley Morgan, as shown in your issue of December 18th, 1919, but as 75% of the heat is around the head of the cylinder, I should think it only necessary to cool that portion.

Would it not be better to have the air space around the head of the cylinder the same size throughout, so as to have a clear passage of cold air passing at each impulse?

Enclosed is a rough sketch of the idea. I must admit, however, the spiral core might be a trifle awkward in moulding. RIDER. Warrington.

CAVEAT EMPTOR.

Sir,-Speaking from my knowledge of the motor trade generally, and from my own personal experience, I do not think that motor cycles (and for the matter of that, cars also) were ever being turned out so badly as at present. With the exception of perhaps half-a-dozen makes of machines, which are generally beyond reproach, it seems to be entirely a matter of luck whether one gets a good or a bad motor cycle. We, as motor cyclists, are as a rule handicapped by reason of our not being able to get a trial run before purchasing, therefore it behoves those of us, to whom the present high prices are of consequence, to make a point of carefully examining new machines as far as possible before taking delivery, especially the vital parts,

A PEEP INTO THE FUTURE The first hill-climbing competition on the new "Bump" bicycle depicted by a reader, Mr. H. W. Moss.

such as engines and gear boxes, and to insist on seeing that all parts are properly adjusted, and at least in running order. Unfortunately, manufacturers are in a position to order. Unfortunately, manufacturers are in a possible say, "Take it or leave it," and many agents do not care say, "Take it or leave it," and many agents do not care what they sell so long as they can sell it; but if we want to us to insist on getting properly finished machines, even at the sacrifice of a larger output. Personally, I have always found the chief offenders in this respect to be assemblers of motor cycles; not those who, in the strict sense of the word, manufacture them, but those who buy the various parts and put them together, or stick them together, as the case may be, many of whom cannot even properly build a wheel. After keeping a vow for several years never again to buy a machine of this kind, I was tempted some weeks ago to give an order for another, a so-called lightweight, for which the makers have the impudence to ask nearly the price of a countershaft Triumph. The condition in which this machine was sent to the agents was simply disgusting; some parts of it would not even have done credit to a blacksmith. I will avoid going into details which would encroach even more than I am doing upon your valuable space, and suffice it to say, that I absolutely refused to take delivery. Fortunately for me, I am never without a trusty Triumph, no matter what other machines I may or may not possess; but even if I had not been in this fortunate position, I should still have refused delivery of this machine.

Thanking you for the many happy days this year which your publication has afforded me ENTENTE. London.

GOOD SERVICE.

Sir,-I recently placed an order for a motor cycle accessory Sir,—I recently placed an order for a motor cycle accessory with a leading London firm, and sent a cheque in advance. I received a polite reply and promise of attention, but no goods. After some waiting I placed the order with cheque with another London firm. Result, exactly the same. After weeks of waiting I sent my order to Harrod's, London. Result, goods arrived in due course.

I think that other motorists who may have had similar difficulties to mine may be glad to know of a place where orders get promptly executed.

"THE MOTOR CYCLE" ROAD MAPS.

England and Wales, Scotland, London (showing roads into and out of London and avoiding London).

Mounted on linea. Set of three, complete in case

Obtainable by post (remittance with order) from ILIFFE & SONSLtd., 20, Tudor Street, Loadon, E.C.4, or of leading Booksellers and Railway Bookstalls.

QUESTIONS PREPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Sparking in Contact Breaker.

Will you advise me why my Ruthardt magneto sparks at the platinum points? What would you advise me to do, as it will only spark occasionally and then ceases for a time, and so on?—W.E.H. Excessive sparking at the contact breaker platinum points indicates a defective operation of the condenser, and we should advise you to submit your magneto to C. A. Vandervell and Co., Ltd., Warple Way. Acton Vale, W.3, who formerly handled the Ruthardt.

Gear Ratios.

Will you inform me what size engme sprockets I should need to give a 4 to 1 top gear on one machine and 4½ to 1 on another?
Both machines have 20in. belt rims and 8in. pulleys on gear box. Clutch sprocket has 36 teeth. What size belt rim should I need with an 18 T. engine sprocket, 36 T. clutch sprocket, and 8in. gear box pulley?—T.S.

With the sprocket and pulleys already fitted to your machine, you would need a 22 tooth engine sprocket to obtain a 4 to 1 gear ratio, and a 20 tooth sprocket to obtain a 4½ to 1. To obtain a 4½ to 1. To obtain a 4½ to 1 gear, using an 18 tooth engine sprocket, the rear belt rim should be 18m. in diameter.

Wheel Building.

1 am about to fit my 5½ h p. British Excelsior with a 650 × 65 mm. back wheel, therefore 1 should be greatly obliged if you could give me.a. little information that would enable me to build the wheel myself, i.e.; (1.) The correct method of arranging spokes from hub to rim. (2.) Is there any particular way of crossing the spokes? (3.) The general method employed in truing up the wheel?—H.C.S.

(1.) We should recommend you to have the wheel rebuilt by an experienced cycle mechanic, and wheel building is a trade in itself, and if you are not skilled in it, we do not think that the result will be very satisfactory, should you at tempt it yourself (2.) In truing a wheel, the method is alternately to tighten and slacken the spoke nipples until the rim runs truly, both circumferentially and centrally with the bub. When this is completed the tension of all the spokes should be equal. Experience alone can make you an expert in this process.

Removing Timing Pinion.

Will you please inform me if the crankshaft pinion of the 1914 Douglas 23 h.p. engine has a right or left-hand thread?— A.J. C.

The crankshaft pinion on the 1914 Douglas is not screwed on at all; it is a tightly pressed fit on a parallel shaft. Possibly you refer to the retaining screw in the end of this shaft, which has a right hand thread.

Surging in Inlet Pipe.

(1.) Do the unequal periods between the induction strokes of a V-twin cause "surging" of the mixture in the T-shaped inlet pipe, and, consequently, unequal distribution of gas to the two cylinders? (2.) If such is the case, which cylinder is adversely affected—front or rear? (3.) Is it possible to overcome this defect by making use of a special timing for the inlet valve of the cylinder affected? (4.) Can you give particulars of such a timing?—R.F.M.

(1.) You are correct in supposing that the unequal periods between the induc-

tion strokes of a V-twin engine cause surging of the mixture. (2.) Skilful design of the induction pipe and ports will eliminate any bad effects. It is impossible to say which cylinder will be adversely affected, as everything depends upon the design. (3.) Slight variations in the timing of the two cylinders are sometimes adopted, but if this is not done by the makers, the usual form of timing gear prevents it being done subsequently.

Moto-Reve Questions.

I should like your opinion on a twin-cylinder 2% h.p. Moto-Réve, especially as regards maximum speed and ease of starting. Will you give some particulars on starting and running a motor cycle?—A.T.H.T.

Moto-Rève motor cycles were made in Switzerland, and they have not been imported into this country for some years. They were quite well made, but of very light parts. They are capable of about 35 m.p.h. on the level. With the standard carburetter they were not particularly easy to start. They are much improved, however, by having a good modern lightweight carburetter

Flooded roads are now frequently met with in many parts of the country, but waterproof magnetos and chain drive have eliminated the old trouble that attended the passing through flood water.

Charging from Alternating Current.

(I.) Is it possible to charge accumulators from the switch terminal of a magneto by using terminal of a magneto by using terminal of a magneto by the Noden chemical rectifier which converts alternating current to direct current? (2). What is the approximate voltage of the A.C. current generated by a Bosch magneto, a Labella hours to transform down as I should have to transform down to the necessary voltage? (3.) Would it be detrimental to the magneto, and what effect would it have on the spark at the plugs?-H.S.

(1.) It would no doubt be possible to charge an accumulator from the low-tension circuit of the magneto, by using the Noden valve. (2.) The maximum voltage is approximately six. (3.) It would not harm the magneto, but the spark would be considerably weakened at low speeds, and you would not be able to start with the battery in circuit.

Two-stroke Efficiency.

(1.) Is it possible and practi-cal to make a diagram, on crankshaft degrees, showing opening, and closing of the ports in a two-stroke engine? (2.) Why is the explosion of a two-stroke engine is the explosion of a two-stroke engine less powerful than that of a four-stroke engine of similar capacity? (3.) Which of the following types of engine is theoretically the most efficient, and which suffers the least from heat losses, provided that the bore and stroke are similar in all cases: (a) A two-stroke are similar in all cases: (a) I with Scott type of stroke are similar in an eases: [a] A two-stroke engine, with Scott type of piston; (b) a two-stroke engine, with Connaught type of piston; (c) a four-stroke engine, with overhead valves inclined to one another; (d) a four-stroke engine, with side by side stroke engine, with side valves?—F.M.A.

(1.) A timing diagram can be made to apply to the two-stroke engine quite as easily as to the four-stroke type. (2.) The maximum effective pressure in a two-stroke engine is less than that of a four-stroke of similar capacity, because the volumetric efficiency of the former type is not so great as in the latter. In all such comparisons it is assumed that all such comparisons it is assumed that compression ratios and other details bear a reasonably close relationship in each case. (3.) Theoretically, the four-stroke engine, with overhead valves inclined to each other, is the most efficient type, since the volumetric efficiency is greater and the heat losses smaller than in the other designs you mention.

Hub Gear, Magneto, and other Queries.

(1.) How can I adjust clutch and gears of a 1914 T.T. three-speed Mark VII. Armstrong motogear for 8 h.p.? The clutch will not work at all. I start in low and change to middle all right, but cannot change to high or down again to low without stopping. (2.) How should I test a Bosch magneto, type DA2, and where can I obtain any handbook concerning it? (3.) Is it possible to increase compression of a 3½ h.p. J.A.P. engine? It turns quite easily by hand with valve lifter down. (4.) What alteration is necessary to a Senspray carburetter to use benzole, and what make of benzole would you recommend ?-A.L.

(1.) It your gear is of the correct T.T. pattern no clutch is fitted. The gears are adjusted by securing the control lever in the position marked "adjusting" on the quadrant. The road wheel should then run freely and without noise, while the belt rim is stationary. If it does not do so, tighten or slacken the milled adjuster on the control rod until the necessary free running is obtained. [2.) You do not say to what particular tests you wish to subject your magneto. If you merely require to know its working efficiency a good spark at the plug will be sufficient evidence. (3.) Evidently the engine is in poor condition, and it will probably need new piston rings, and the valves will also require griding in (4.) probably freed new piscon rings, and valves will also require grinding in. (4.) Slightly lower the petrol level, also fit a jet two sizes smaller. Benzole which conforms to the N.B.A. specification can be thoroughly recommended.

[] >>>>>>>>> THE NEXT STAGE!

MOTOR CYCLISTS interested in small or large cars should read

The Autocar

the forerunner of all motoring journals. Founded in 1895, it remains the largest and most successful automobile paper, and enjoys the greatest circulation. It is universally. accepted as the representative British motoring journal.

Flooding Carburetter.

(1.) My machine is a Big Four Norton and sidecar. Until a few days ago I could do 70 miles per gallon, and now can-not do more than 20. The engine eight strokes at low speed, but has great power, as I have not yet seen a hill which cannot be taken on seen a min which cannot be taken on top gear. If the engine is running even with the pilot jet the whole air must be given. Controls seem to be all right. If I am using the pilot jet on the level or down hill it misfires and eight strokes continually, but if a small right agreement carry. small incline appears as soon as I go uphill the engine picks up and runs much hetter. I quite understand that too much petrol is passing to the engine, but not being acquainted with the B. and B. carburetter I do not see the way to remedy it. (2.) The machine is fitted with the Sturmey-Archer gear When low gear is Archer gear When low gear is engaged for a few minutes, for traffic work, it begins to race and the clutch gear slips. This slipping is not felt when going on second or third speeds.—J.U.

(1.) Apparently your carburetter is flooding. This is rather unusual on the top feed B. and B., and may be caused by the collar on the needle having altered its position, or by a small obstruction in the valve seating, which prevents the needle closing the orifice completely. A further possible cause may be that the float is punctured and weighed down with petrol. You can ascertain this by removing the float and shaking it, noticing if you can hear the (1.) Apparently your carburetter is flooding. This is rather unusual on the shaking it, noticing if you can hear the petrol inside. (2.) It seems almost im-possible that the clutch should slip on low gear if it does not do so on top. In all probability you are mistaking the fact that the engine is racing on a light load for symptoms of clutch slipping.

READER'S REPLY. Belt Trouble.

Re queries on belt trouble and your reply in the issue of December 18th. Might I suggest, from my own experi-ence, that belt wear is also very much accentuated by changing the direction in which the belt runs. With a Rudgewhich the belt runs. With a Rudge-Multi I find belts wear well until, through oversight, perhaps after shortening, the belt is put on again the opposite way round from which it was taken off. To avoid this I now mark an, arrow on the top pointing towards the engine pulley to ensure replacing the belt always in the same direction after taking it off for any purpose.—H. W. Jessor.

RECOMMENDED ROUTES.

Charging from Alternating Current.

(1.) Is it possible to charge accumulators from the switch accumulators from the switch terminal of a magneto by using the Noden chemical rectifier which converts alternating current to direct current? (2.) What is the approximate voltage of the A.C. current generated by a Bosch magneto, as I should have to transform down to the necessary voltage? (3.) Would it be detrimental to the magneto, and what effect would it have on the spark at the plugs?-H.S.

(1.) It would no doubt be possible to charge an accumulator from the low-tension circuit of the magneto, by using the Noden valve. (2.) The maximum the Noden vaive. (2.) The maximum voltage is approximately six. (3.) It would not harm the magneto, but the spark would be considerably weakened at low speeds, and you would not be able to start with the battery in circuit.

Two-stroke Efficiency.

(1.) Is it possible and practi-cal to make a diagram, on crankshaft degrees, showing opening and closing of the ports in a two-stroke engine? (2.) Why two-stroke engine? (2.) Why is the explosion of a two-stroke engine less powerful than that of a four-stroke ess powerful than that of a four-stroke engine of similar capacity? (3.1) Which of the following types of engine is theoretically the most efficient, and which suffers the least from heat losses, provided that the bore and stroke are similar in all cases : (a) A stroke are similar in all cases: (a) A two-stroke engine, with Scott type of piston; (b) a two-stroke engine, with Connaught type of piston; (c) a four-stroke engine, with overhead valves inclined to one another; (d) a four-stroke engine, with side by side valves?—F.M.A.

(1.) A timing diagram can be made to apply to the two-stroke engine quite as easily as to the four-stroke type. (2.) The maximum effective pressure in a two-stroke engine is less than that of a four-stroke of similar capacity, because the volumetric efficiency of the former type is not so great as in the latter. In all such comparisons it is assumed that compression ratios and other details bear a reasonably close relationship in each case. (3.) Theoretically, the four-stroke engine, with overhead valves inclined to each other, is the most efficient type, since the volumetric efficiency is greater and the heat losses smaller than in the other designs you mention.

Hub Gear, Magneto, and other Queries.

(1.) How can I adjust clutch and gears of a 1914 T.T. three-speed Mark VII. Armstrong motogear for 8 h.p.? The clutch will not work at all. I start iu low and change to middle all right, but cannot change to high or down again to low without storager (2) How to low without stopping. (2.) How should I test a Bosch magneto, type DA2, and where can I obtain any handbook concerning it? (3.) Is it possible to increase compression of a 3½ h.p. J.A.P. engine? It turns quite (A) by hand with valve lifter down. (4.)
What alteration is necessary to a Senspray carburetter to use benzole, and what make of benzole would you recommend ?-A.L.

(1.) It your gear is of the correct T.T. pattern no clutch is fitted. The gears are adjusted by securing the control lever in the position marked "adjusting" on the the position marked "adjusting" on the quadrant. The road wheel should then run freely and without noise, while the belt rim is stationary. If it does not do so, tighten or slacken the milled adjuster on the control rod until the necessary free running is obtained. (2.) You do not say to what particular tests you wish to subject your magneto. you wish to subject your magneto. If you merely require to know its working efficiency a good spark at the plug will be sufficient evidence. (3.) Evidently the engine is in poor condition, and it will probably need new piston rings, and the valves will also require grinding in. (4.) Slightly lower the petrol level, also fit a jet two sizes smaller. Benzole which conforms to the N. R. A. proceifections. conforms to the N.B.A. specification can be thoroughly recommended.

THE NEXT STAGE!

MOTOR CYCLISTS interested in small or large cars should read

The futocat Every 3d.

the forerunner of all motoring. journals. Founded in 1895. it remains the largest and most successful automobile paper, and enjoys the greatest circulation. It is universally accepted as the representative British motoring journal.

Flooding Carburetter.

Flooding Carburetter.

(1.) My machine is a Big Four Norton and sidecar. Until a few days ago I could do 70 miles. per gallon, and now cannot do more than 20. The engine eight strokes at low speed, but has great power, as 'I have not yet seen a hill which cannot be taken on top gear. If the engine is running even with the pilot jet the whole air must be given. Controls seem to be all right. If I am using the pilot jet on the level or down hill it misfres and eight strokes continually, but if a small incline appears as soon as I go small incline appears as soon as I go uphill the engine picks up and runs much better. I quite understand that too much petrol is passing to the engine, but not being acquainted with engine, but not being acquanted with the B. and B. carbunetter I do not see the way to remedy it. (2.) The machine is fitted with the Archer gear When low gear is engaged for a few minutes, for traffic work, it begins to race and the clatch line. This clays is not file within slips. This slipping is not felt when on second or third speeds.—

(1.) Apparently your carburetter is flooding. This is rather unusual on the top feed B. and B., and may be caused by the collar on the needle having altered its position, or by a small obstruction in the valve seating, which prevents the needle closing the orifice completely. A further possible cause may be that the float is punctured and watched down with nearly may be that the float is punctured and weighed down with petrol. You can ascertain this by removing the float and shaking it, noticing if you can hear the petrol inside. (2.) It seems almost impossible that the clutch should slip on low gear if it does not do so on top. In all probability you are mistaking the all probability you are mistaking the fact that the engine is racing on a light load for symptoms of clutch slipping.

READER'S REPLY. Belt Trouble.

Re queries on belt trouble and your reply in the issue of December 18th. Might I suggest, from my own experience, that belt wear is also very much accentuated by changing the direction in which the belt runs. With a Budge-Multi I find belts wear well until, through oversight, perhaps after shortening, the belt is put on again the opposite way belt is put on again the opposite way round from which it was taken off. To avoid this I now mark an arrow on the top pointing towards the engine pulley to ensure replacing the belt always in the same direction after taking it off for any purpose.—H. W. Jessor.

RECOMMENDED ROUTES.

ELLESMERE TO LOUGHBOROUGH .- J.P.B. Ellesmere, Whitchurch, Woore, Stone, Uttoxeter, Burton, Ashby-de-la-Zouch, Loughborough.

Simplicity.

IMPLICITY should be the keynote of all designs, and it is satisfactory to note that more manufacturers are now giving attention to the point. Simplicity, however, does not necessarily mean that a machine should be shorn of the many items of specification which make it efficient, but rather should it make for greater all-round efficiency. general reduction of separate parts, while retaining every advantage of the most fully equipped machine, is the chief essential of simplicity in motor cycle design; and, to secure this end, a machine must be so designed that the term also applies to methods of construction, ease of handling in assembling, and accessibility in dismantling.

A single-speed two-stroke with a single lever carburetter represents one type of simple machine, where simplicity has been obtained by elimination which reduces its scope, but we have in mind more ambitious mounts, in which a single unit is made to serve where half a dozen are employed in the conventional type of

Simplicity may be looked on from various view points, but that of the rider is one of the most important, so that such details as single Iever carburetters and automatic lubrication may be regarded as simplifying the machine. Simplicity implying risks must, however, be avoided, and it is useless, for instance, to control the whole vehicle by one lever if this entails extra complication in tracing a defect, or increases the cost of manufacture.

In addition to certain obvious means of reducing the number of parts, both complete units and a number of members built up as a unit, there is now a school of designers who aim to decrease the total of parts by half, and, again, so design their units that the number of operations necessary to produce them also are greatly reduced. Several such designs already have appeared in the columns of The Motor Cycle,

but few, so far, have reached the stage where they are commercial propositions. When they come on to the market, they are bound to influence subsequent design. This date is not so far distant as may be imagined.

The Motor Cycle Thief.

THE theft of motor cycles is becoming so common that the subject is worthy of very serious consideration. In some cases the owner deserves some of the blame for negligence in leaving his machine unguarded for long periods. A chain and padlock or other simple device are sufficient to deter the majority of thieves from stealing a machine from the roadside, especially in a populated district. There is, however, an insidious type of thief who obtains access to a motor cycle by means of answering advertisements for sale or by applying for a trial run. This type of theft requires further precautions. Naturally, an owner who is anxious to sell his mount does not care to refuse a reasonable trial run, and equally a forged telegram to the owner's wife or people is not likely to arouse suspicions during his absence at business.

Therefore, it behoves all who have motor cycles for sale to act warily: to refuse a trial run unless a satisfactory deposit is first paid over, and to give strict instructions to all whom it may concern that the machine is on no account to leave its garage in the absence of the owner. We receive, almost daily, stories of daring thefts, with details of the machine, in hopes of recovery; but the man who succeeds in taking charge of a motor cycle in the absence of the owner is likely to be clever enough effectually to disguise the motor cycle. Our sympathies are extended to those who have suffered, and we hope that their misfortunes may serve as a warning to others. In the meantime, the risks of loss through theft are such that add one more reason why every motor cyclist should protect himself by insurance.

A "Passenger" Six Days.

AM not in the confidence of our motor cycling politicians, nor have I heard any rumour that the R.A.C. and A.C.U. intend to revise their respective shares in the control of light passenger But if we look ahead, it is difficult to arrange a programme for the 1920 trials without lumping all the passenger machines together in a separate event from which motor cycles should be On the one hand, the A.C.U. Six Days are already becoming too cumbrous and unmanage-. able-it is quite difficult to secure the accommodation required for such huge entries, and the exclusion of sidecars and three-wheelers would simplify matters. On the other hand, it would be a great absurdity for the A.C.U. to test all the sidecars and runabouts, whilst the four-wheeled cycle cars figured in the cheaper classes of a "Light Car Trial" run by the R.A.C. In fact, such a divorce would be a calamity all round, both technically and commercially. Technically, it has yet to be proved whether the sidecar, the runabout, or the "quadricycle" is the best cheap proposition for two passengers. Commercially, all three types compete against each other, and should therefore be tested in each other's company. The logical plan from every point of view is to organise a "Passenger" Six Days in 1920; and the chief practical difficulty is to arrive at a satisfactory classification. I am inclined to agree with Mr. L. Francis Jones that, though price forms a somewhat arbitrary canon, it should be the least objectionable Like the lawyers, we cannot legislate for hard cases; and if one or two machines are crowded out of the competitions by a margin of \pm ,5 in their list price, that is their funeral.

Nomenclature.

F late years terminology in the sphere of light motors has lost its old accuracy, and a certain amount of inconvenience has resulted. years ago each type of machine had a definite and unmistakable appellation. We spoke of sidecars, tricars, and quadricycles ("quads," for short), and everybody knew exactly what was meant. To-day, as the result of blundering definitions which are already obsolete, the two terms in commonest use, "runabout" and "cycle car," are both excessively vague. A Morgan can be referred to by either term. An American might apply either to the G.N., but six motor cyclists out of ten reserve "runabout" (quite illegitimately) for three-wheelers. So we become afflicted with such frightful mouthfuls as "three-wheeled runabout," "sidecar combination," and other verbal atrocities. Really, the obsolete names "tricar" and "quad" were much more workmanlike; "tricar" philologically ought to cover sidecars, but never did, and ousted the more accurate term "forecar." If we cannot evolve accurate names, let us at least fix on something brief and to the point. Unfortunately, so long as control is divided, it is nobody's business to attend to such matters, and the trade continue to complicate our language by advertising "super runabouts," "threes," "tandems," "mono-cars," and so forth. Yet we must all admit the difficulty of simplifying control when the "quad," merges into the light car and the light car into the medium car by a series of infinitesimal gradations.

Two Desiderata.

RANTING that terminology is a trivial matter, affecting convenience and nothing else, I fancy the first urgent matter is the 1920 Six Days programme, which surely ought to include three events:

(1.) Motor bicycles, organised by the A.C.U. (2.) Passenger motor cycles, organised by -

(3.) Light cars, organised by the R.A.C.

This scheme would mass together for road competition purposes vehicles which actually are commercial competitors, and would vastly assist the buyer to make a selection, the manufacturer to determine his policy, and the designer to clear his wits, especially so far

as event 2 is concerned.

The next urgency is a decision about the classification and control of the vehicles concerned in event 2. Classification, as I have already suggested, should preferably be by price. When this point is settled, a second problem arises. There are three claimants to control, or to a share in control: the R.A.C., the Junior Car Club, and the A.C.U. There is much to be said in favour of a separate organisation in the interests of each separate type of vehicle. The motor cycle never went ahead until it was divorced from the Automobile Club, and entrusted to the Auto Cycle Union. Light quads (e.g., the 7 h.p. Swift and the G.W.K.) were hampered by association with other types of vehicle; the G.W.K. lost credit by being classed with motor bicycles in its early competition feats; and the 7 h.p. Swift was grossly overshadowed by more refined vehicles in the Harrogate Light Car Trial, in spite of its splendid performances.

Against a Cycle Car Club.

N the other hand, there is no existing body to which the supreme control of the passenger motor cycles can safely be transferred; and if such a body is developed out of existing organisations, or formed de novo, precautions must be taken to prevent it splitting up the organised forces of motordom more lamentably than they already are. I believe the Junior Car Club contains enough talent to organise a good Six Days Trial on the lines suggested. On the other hand, its financial resources are not unlimited;

Occasional Comments,-

and a club with a shallow purse is always tempted to kow-tow to the trade, and make its events too easy, so that they do not weed out the duds-we saw a lot of this in the early days of motoring. Moreover, up to the present the Junior Car Club is interested in the bijou Rolls-Royce type of four-wheeler, and such cars necessarily overshadow the genuine quad whenever the pair mect. It is like standing a man half a bottle of Bollinger and then a quart of Government ale. Personally, I should like to see a Junior Car Club, which was rechristened, endowed to the tune of a thousand pounds or so, closed to all vehicles listed at more than £,200 or £,250; and put in absolute control of all three and four-wheelers under that figure, including sidecars. These ideas may serve as provocative of discussions which are badly needed as a preparation for the politics of cheap motoring during 1920.

Woman and the Motor Cycle.

WAS hugely tickled by Col. Moore-Brabazon's charming treatise on broader for interesting treatise on broader for interesting treatise on broader for interesting treatise. drop-framed horse. I am open to conviction, but I am not quite sure he is right in pleading for the girls to don knickers and ride diamond frames instead of sticking to their skirts and demanding open frames. It is quite true that during the war many girls appeared as bipeds. Col. Moore-Brabazon was also visible in Bond St. in a pale blue suit with gold lace on the peak of his cap. But there is all the difference in the world between uniform and civvies. The hon, member's record shows that he is a man of courage. But he would hardly dare to walk down Piceadilly in a turquoise blue frock coat with a gilt

opper. Similarly many damsels hesitate o motor cycle in civvy knickers: it was therwise when they compulsorily wore he togs of a Wraf or a Wren or a Waac. Particularly does this hesitation apply o the dismounted moments. Suppose a irl is on tour with a brother, both iding T.T. solos. She enjoys her

breeches all along the road. At night they put up at the "Empire" at Bath, let us say. It is difficult to carry frocks on the carrier, and not every girl cares to wear breeches in a dining room where every other woman is in skirts. I hope we shall establish feminine breeches as a standard fashion, but it is not yet certain. On the other point, I go all the way with Col. Moore-Brabazon. We want the girl on the saddle quite as much as the girl in the sidecar. But when many men are clamouring for a machine that can be ridden in ordinary clothes, it seems odd that a notable authority should ask women to put up with a type of frame that is mechanically unnecessary and practically unsuitable. My own position is that I am rather looking for machines like the Scott, because I find a long coat handy on occasions.

Speed Wobble.

7ILL Lt. Olechnovitch please answer two objections to his theories about speed wobble? He will hardly find a machine on the road which has its front wheel centre in the line of the steering head axis, yet a large percentage of existing machines do not wobble at the speeds which are within their compass. Secondly, what machines have their centre of gravity in or below the horizontal plane in which the wheel centres are located? This position of the C.G. is surely almost an impossibility when a rider is in the saddle? My own champion wobbler is now on a visit to the factory, as I have succeeded in interesting its designer on the subject of its eccentricities; but I have owned other machines which failed to conform to Lt. Olechnovitch's ideals, and yet did not wobble. The machine in question is peculiarly interesting, as it wobbles at all speeds!

(Left) This photograph will convey a good idea of one of the worst parts of Brooklands track as it exists at the present time. Repairers are busy, however, on putting the course in order for this year's activities, and a great amount of -repairing has already been accomplished.

(Right) A pre-war scene at Brooklands. The start of a sidecar race.

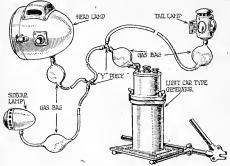

CETYLENE LIGHTING ITS BEST.

Some Notes on the Care and Use of Acetylene.

HE recent London to Exeter run seems to point to the fact that a great number of riders have not yet learned to minimise, much less entirely to avoid, trouble with acetylene lighting outfits.

It was astonishing to see how many competitors, during the hours of darkness, were delayed at the side of the road, often in the pouring rain, taking their generators to pieces. It is out of sympathy that I feel constrained to give them and others the benefits of my experience. Most riders, I notice, favour the plan of having several generators, one for each lamp, and this, to my way of thinking, is a cause of trouble. With the ordinary motor cycle generator, taking a charge of carbide of about a quarter of a pound, it is difficult to maintain an even pressure of gas. The space being so confined and the carbide swelling with the water tends to choke up the gas passage and the water feed.

The proper way to prevent nearly all troubles is to run all the lamps off one large generator. I agree that a large generator on a motor cycle or a sidecar combination is somewhat unsightly, but I feel sure that most of my readers will put up with that if they can secure efficiency with a modicum of attention. A light car generator, holding a charge of carbide of not less than one pound, is the minimum size that I recommend. It does not matter, except from the point of view of initial expense, how large the generator may be. The best place in which to put the generator is on one of the horizontal back stays of the motor cycle, and if a sidecar combination is used the lefthand stay gives the best position. A couple of split lugs should be procured to fit the size and section of the stay, and into each of these lugs should be brazed

The gas lighting equipment suggested by R. Creak Davis, who has had long experience of night riding.

hard wood, such as oak or teak, upon which to mour the generator. If the generator be fixed in this positio it is screened to a great extent by the rider, and further, the regulating screw for the water is easily

Connecting the Lamps.

Having fixed the generator securely, an indiarubbe gasbag of fairly large size should be secured to th gas outlet from the generator. Most gasbags ar made with a stout piece of rubber tubing protrudin into the gasbag for about two-thirds of its length thus forming a trap for water produced by cordensation. It is essential, of course, in fixing th gasbags that this thickened protruding piece shoul be at the bottom of the bag. Having fixed this gasba to the generator, if a motor cycle only is in contempla tion, a brass Y piece should be obtained and pushe into the gasbag connection. From the ends of th Y piece lengths of rubber tubing can be taken to th head and tail lamps. If a sidecar combination i being dealt with, the connection for the tail lamp wil be the same, but the method of carrying the rubbe tubing to the head and sidecar lamps will be some what different. From the forward end of the Y piec take a piece of rubber tubing along the side membel of the sidecar chassis, and then continue it upward along one of the forward diagonal struts. At thi point attach another brass Y piece, and to this con nect the head and sidecar lamps. Brass tubing car be used if desired instead of rubber tubing, but i has the disadvantage that it corrodes, to a certain extent, because of condensation, and is more difficul to clean out.,

The easiest way of securing the rubber tubing to the various parts of the frame is to use insulating tape. taking great care, if rubber tubing is used, no to pinch the tubing. Having arrived at this stage fix a rubber gasbag, of somewhat smaller size than that on the generator, to the head and sidecar lamps and, if possible, secure the lower ends of the gasbags to some convenient place to prevent chance of kinking

Acetylene Lighting at its Best .--

in the bags themselves. Similarly attach quite a small gasbag to the tail lamp, and also see that any chance of kinking here is obviated. Occasionally the gasbags should be detached from the lamps and the generator and any water removed, but it will be found that this is not often necessary.

Service to be Expected.

Should any of the burners become sooted, a few brisk applications of the tyre pump to the burner socket will almost invariably remove the obstruction. Sometimes the generators are fitted with a felt pad to filter the gas, and I have found this so-called refinement one of the greatest causes of trouble. In every case without exception I advise that this padshould be removed and never replaced.

As regards the size of carbide most advisable to use, I have found that lumps just able to pass through an inch mesh are most suitable; never should small carbide as sold for cycle lamps, be used on a motor cycle if trouble is to be avoided. It is the custom with cycle car and car generators for the makers to fit a riddling grid to the generator. If such a pattern

generator is to be used on a motor cycle, I advise the abandonment of the grid because the vibration is much greater on a motor cycle than on the running board of a car, and uneven illumination, unless the grid is removed, is almost bound to ensue.

With the average generator, although the light may only be required for fifteen minutes or so per day, one charge of carbide will not last more than three occasions, mainly because a great deal of carbide is wasted even after the water has been furned off. In my own experience I have found that a large generator will run two head lamps and a tail light for half to threequarters of an hour every day for a week, and will give continuous burning of such three lamps for competition work for six to seven hours.

To make a neat and serviceable joint between rubber tubing and gasbag use a small length of a couple of inches of brass tubing. Copper tubing should never be used. Many years ago I used copper tubing until one day, finding a junction piece much corroded, I attempted to remove the corrosion with the blade of a penknife, and, as a result, caused a somewhat violent explosion and scorched my face.

R. CREAK DAVIS.

Back to Plain Bearings?

A Reply to "Ixion's" Criticism on Mechanical Progress.

AM honoured to find that "Ixion" should criticise my article on mechanical progress, but if the Editor can spare a little room I should like to reply to one or two points mentioned in last week's Comments.

I thoroughly agree with "Ixion" that design is "an extremely contentious affair," but taking his remarks

seriatim I would reply as follows. "Ixion" requires overhead valves with cooled stem and springs, and therefore objects to enclosed valves. In The Autocar of January 10th he will find a suggestion (illustrated herewith) from my humble pen for combining these two points. The valve spring and upper part of the stem are exposed to the air, the rocker gear is entirely enclosed, and the lower part of the stem is well cooled through the large radiating surface round the guide.

Next he states that the only ball and roller bearing engines have printable oil consumptions. May I refer him to just two plain bearing engines—the Blackburne and A.J.S. The former is one of the most economical engines, as regards oil consumption, that I have ever handled, and the latter is at least

reasonable for a heavy sidecar machine. No, "Ixion," you must study piston design if you would save oil. The difference in the amount needed (or rather obtained) by the bearings is negligible. Next, the only plain bearing engine with forced lubrication which "Ixion" has ridden "was not a hot-stuffer." I think I can place this machine, and if I am right I also have ridden more than one of the same make. It certainly was not a hot-stuffer, and was not designed as such, for in this respect, as also in regard to consumption

and wear, there are other things to be considered besides lubrication. I certainly never intended to convey the idea that, provided plain bearings and forced lubrication were incorporated in a design, there would be no need to study material or the proportions of bearings, etc. I hate to drag aero engines into a discus-

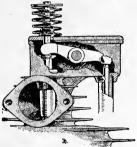

sion on motor cycles; as though we have much to learn from them. They have many features unsuitable for motor cycles, yet, with one noticeable exception, plain bearings and forced lubrication were used on all the really high efficiency aero engines-rotaries and radials may be excepted, and very few of the former, at any rate, had mentionable oil consumption.

With regard to gear box noises, I think "Ixion" must have been unlucky, since, without exception, the three machines which I have owned since the armistice and a dozen or so I have ridden since that date have compared extremely favourably with car gear boxes, both as regards noise and ease of change. I have heard the old De Dion tricycle with Dupont gears, and

from the saddle, too, and the compari-

son seems to me to be a difficult one. If "Ixion" has studied the Raleigh, I am surprised at his remarks re frame distortion. There appears to be very little chance of distortion between the engine and gear box, which is the only place that matters, since he can still skew the rear wheel if he must.

In conclusion, I appreciate "Ixion's" gentle tirage de jambe, as Mr. Punch would have it, and hope that he will take my reply as even further proof "that we are all faddists."

An enclosed valve gear on an air-cooled engine. The rocker is forked at the valve stem, and the springs, whether coil or leaf type, are exposed for cooling purposes.

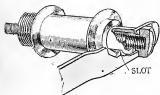

A JAPANESE cycle car is a real novelty, though scarcely a surprise, since it is common knownedge that the Japs do not intend to rely permanently on imported motors. Messrs. Tamura and Watanabe have produced an original, but not too practicable, design. The basis of the patent is the

Tamura and Watanabe's vertical twin runabout. No. 119,225. 15/8/17.

location of an air-cooled engine under the driver's seat, which lifts up for purposes of access, and the provision of a through air conduit under the dash and around the engine. Two grave flaws are evident at the most cursory scrutiny. A tender part of the driver's anatomy will share in any overheating that may develop, especially during a Nippon summer, and the driver is so hoisted up as to interfere with the stability of the cycle car and the passengers' view (it is apparently proposed to provide one seat in front and two helmid). If a flat twin engine were substituted for the vertical twin shown in the drawings, and if, in addition, the driver were equipped with asbestos trousers, the design would acquire real interest.

For Tyre Repairs.

Mr. P. F. Power suggests an improvement on a familiar method of rendering a rear cover or tube removable from a motor hicycle without dropping the wheel, disturbing the transmission and brake connections, or going to the expense and complication of "detachable" wheels (I put "detachable" in inverted commas, seeing that all wheels are detachable, though the term is here re-

Power's hub spindle. No. 128,135, 11/1/19.

served for the modern drop-out variety). Under the original patents, the hub spindle is not long enough to enter the fork slot on the side remote from the driving sprocket; the end of the spindle is coupled to the fork slot by an internally threaded sleeve bolt. The junction of the spindle and the sleeve bolt was

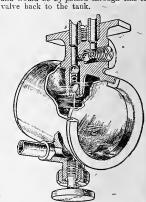

provided with a bearing in a plain collar, pinched between the fork end and the outer cone of the hub bearing. Obviously, by unscrewing the sleeve bolt, springing the forks apart, and removing the collar, clearance could be made to remove a damaged tube or cover. Mr. Power desires to avoid the need for springing the forks apart, and the forks apart ap

proposes to cut a slot on the inner side of the collar, so that the tip of the hub spindle can be dropped through this slot when the sleeve holt has been unscrewed.

A Sight-feed Oiler.

The Douglas people have filed an unusually large number of interesting patents lately, and their new sight feed oiler is quite a novel fitting for motor cycles. Bitter experience has set many riders against the ordinary sight feed drip, because the interior of the glass gets foul if (1) the owner opens the needle valve wide to feed a full charge quickly; (2) if there is too much "blow-back"; from the crank case; or (3) if the outlet pipe gets obstructed. Once fouled, the glass will not cleanse itself, and some patterns are not easy to reassemble after cleansing. The new Douglas sight feed consists of a water chamber into which oil is admitted at the base under pressure, derived either from a spring-loaded hand pump or an engine-driven pump. As the oil is of lower specific gravity than the

water, the oil rises up through the water, and is guided to the outlet pipe by the slender needle of the adjusting device. The oil cannot reach or foul the glass, but is seen passing upwards either in a string of drops or in a thin stream. Moreover, since the pressure is communicated to the water in the chamber, the oil leaves the glass under pressure, instead of merely entering under pressure as in the ordinary patterns. The device is illustrated herewith. Of the two centre hall valves, the lower hall is a check valve, and prevents the water escaping from the glass when no pressure is present. The upper hall of this pair is held open to a greater or less degree by the tip of the ralve: supposing the feed pipe from the glass to the engine should become choked, oil would be unable to enter the glass, and would be by-passed through this side

Douglas sight-feed oiler. No. 129,785.

Unit Frame for Sidecar Outfit.

Detachable sidecars cease to be desirable when a certain weight limit is exceeded, and lighting dynamos and interchangeable wheels hegin to figure in the specification. Mr. L. E. L. Calvert's

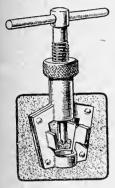

Calvert's integral cycle and sidecar frame. No. 128,010. 15/6/18.

Recent Patents .-

ideas on a "unitary" sidecar combination frame are illustrated on the previous page. Three-point attachment is provided, reinforced by a short cross-piece between the front connecting tube and the down tube of the motor cycle frame.

Simple Belt Punch.

Since Mr. S. T. Robson thinks it, worth while to invent a new belt punch, the walls of certain correspondents on the prevalence of the all-chain drive are shown to be premature, like the announcement of Mark Twain's death. He employs two shect metal blanks, which are riveted together, and further secured by a nut or a ring. I am glad a really cleap belt punch is coming along.

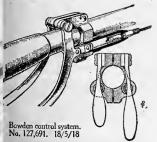

Robson's belt punch. No. 126,267. 24/2/19.

Breaking a belt is bad enough. Finding that one has left the belt punch on the drawing-room mantelpiece is worse. Having to pay five shillings for a new punch after pushing three miles to a garage is enough to make an archangel discourse like a sergeant-major. If Mr. Robson can sell his punch at a shilling, he will save my soul from many potential blotches.

New Bowden Lever.

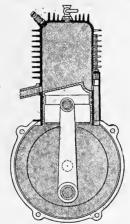

In previous applications of the Bowden wire control system, the radial motion of he hand lever has usually been communicated to the wire, either by a nipple or other anchorage member. This radial effect is net always satisfactory; it throws undesirable strain on the wire,

and puts resistance on the lever, whilst a straight pull would often be more convenient. The illustration depicts a new arrangement which is free from such defects. The member to which the wire is anchored is slidably mounted in straight guides, and is coupled by a short link to an arm projecting from a special belicrank lever, pivoted as shown. The pull on the wire is always straight, and there will be no tendency for the anchorpicce to jam in its slides unless the lever exceeds a certain arc of movement.

Two-stroke Throttle.

We all know that two-strokes are prone to "four-stroke," or even fire in their crank cases when running with a carburetter throttle nearly closed. One reason is that the mixture is compressed in the crank case, which is always much too large to be ideal for such a purpose,

Everingham transfer pipe throttle, No. 129,950, 26/3/19,

and is particularly excessive when a very small charge is under treatment. Various inventors have suggested that the throttle should be located in the transfer pipe, so that crank case compression would be proved efficient.

pipe, so that crank case compression would be more efficient. Mr. Evering-ham follows suit, but considers that the particular type of transfer pipe throttle shown in his drawing is "the best ever."

Douglas cover."

Douglas cover."

Douglas cover."

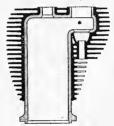

Piston Cooling.

I do not know whether the Douglas patent is merely precautionary, or whether it is to be embodied in a 1920 engine; I should almost suspect the former, seeing that no such system has been found necessary on aero pistons subjected to far greater temperatures than motor cycle engines have to face. The sketch needs little explanation. The piston is provided

with an air chamber in its hollow crown. Beneath the single piston ring and on opposite sides of the skirt are two holes, serving respectively as the air intake and outlet to this chamber. Corresponding air ports pierced in the cylinder walls register with the piston air ports at the bottom of the stroke: during the remainder of the stroke the cylinder ports are covered by the skirt of the piston. The flywheel is provided with vanes and encased; it delivers air at the intake port drilled in the cylinder wall, and this blast drives out the heated air from the chamber. If desired, baffle plates may be cast in the air chamber, so that the internal cooling blast will take a devious course. The invention should add little to the cost of manufacture, whilst it will minimise carbon deposit in the "hottest spot" of an engine.

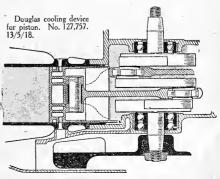

An Aluminium Jacket.

The Villiers suggestion for improved cylinder cooling shown has a flavour of aero engine practice, with sundry novel details. In the first place, a ribbed cooling jacket of aluminium is cast on to a cast iron or steel cylinder, which

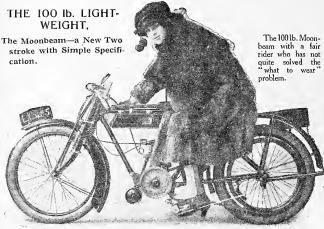

Villiers cooling system. No. 127,856, 21/6/17.

is machined off smoothly. Secondly, this aluminium cooling jacket covers the entire "sub-cylinder,' not merely the barrel portion; the necessary accommodation for valve guides, gas passages, and sparking plug is provided in the jacket. Thirdly, the construction lends itself to the conversion of existing cast iron units, from which the projections may be machined off, so that an aluminium jacket may be cast on.

MOTOR GCLE

THOSE readers of either sex who favour the extremely simple and light two-stroke machine will be interested in the Moonbeam motor cycle, which has been placed on the market by the M.R.P. Trading Co., 62, Pall Mall, London, S.W.1

Its motive power is a 23 h.p. twostroke engine (70×70 mm., 269 c.c.), which has roller bearings throughout and

Owing to its extremely light weight (and rate that it has a low saddle position (having 24in. Xein. Kempshall tyres), the

machine may be easily paddled off.

In future models there will be an auxiliary horizontal tube to the frame, while another model is made fitted with a two-speed gear.

A NEW FLAT TWIN WITH 5-7 h.p. ENGINE.

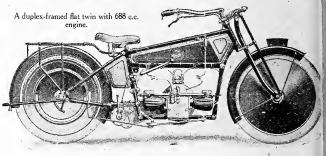

JUST as the introduction of the J.A.P.
Precision, and Villiers engines enable
a number of comparatively sma'
makers to produce motor cycles of thes
types, so may the advent of a proprietar
flat twin be responsible for an increas
in the number of "makes" fitting thi
type of engine

in the number of "makes" niting unitype of engine.
We have several times referred to th 5-7 h.p. Coventry Victor engine, which has a capacity of 688 c.c. This engin apparently is being taken up by severafirms, together with the special framparts designed by the Coventry Vict. Co. to accommodate it.

One of the latest machines embodying

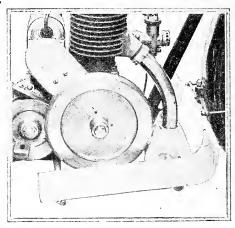

One of the latest machines embodyin the Coventry Victor specialities is the Regent, which is handled by Reger Motor Cycles, Ltd., 116, Victoria Stree Westminster, London, S.W.I. The lower portion of the dupley from

THE VERUS '4.

WING to the demand for sidecar outfits, the majority of manufacturers of 500 c.c. machines make such models more suitfor attaching abla sidecars than for use as solo mounts. One of the exceptions, however, is the new Verus "4," a Blackburne engined machine, which is bound to appeal strongly to the solo rider, especially he who is short in the We recently tried one of these machines, and were much struck its compactness, bv comfortable riding position, and ease of handling. It represents a type of mount for which many solo enthysiasts have waited for some time—"a little machine engine." with a big

Aluminium footboards specially designed for the

FOOTBOARDS FOR TRIUMPH JUNIOR.

THERE appears no doubt that for al but sporting machines the footres now takes second place to footplate in popularity. This is illustrated by the demand known to exist for footboard which may be fitted readily to existing machines having footrests. It is no always an easy matter to convert a "foot rest" machine, however, and probably one of the most difficult in this respect is the Triumph Junior, but Messrs. Brandisi and Sons, of 625, Foleshill Road, Coven try, who specialise in fitments for Triumph motor cycles, have overcone these difficulties in a very neat manner. The front end of their patent aluminium footboard, incidentally where very little weight is carried, is supported on a bolt which passes through the silencer end plates, the back being connected to the existing rod with the standard footpads removed. The lugs through which the bolts pass are amply large and a deep web is cast on the underside of the footplates for stiffening purposes.

are provided, and the appearance of the machine is enhanced by the fitting of the boards, which sell at 34s. 6d. per pair.

Spring Device for Rigid Frames.

Conversion Set for Use on Existing Machines.

HE idea of providing a device to convert existing rigid motor cycles into spring frame mounts is not new, at it continues to attract many motor cling inventors, who from experience against machine and rider from road ocks. Usually, however, results have en only suitable for sidecar machines, d those which may be used in safety solo machines have been few indeed. Mr. J. A. Barnes, of 38, Mariborough ad. Coventry, has made and patented device which for several years has been

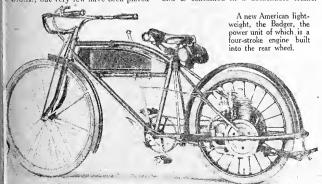

Showing the principle of the springing

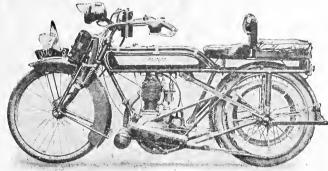

An American Lightweight.

A Motor-assisted Bicycle weighing 126 lb.

ANY years ago the Singer Co, introduced a motor cycle which had the power unit in the back wheel the machine, and only recently we saw the of these in service. From time to me the same idea has been followed in per designs both in this country and c U.S.A., but very few have been placed

A combined system of springing, insulating both the driver and passenger on the pillion seat, fitted to a single-cylinder Humber.

undergoing test almost entirely as a single tracker; in fact, this designer is a pillion enthusiast, who has travelled many thousands of miles with his wife as passenger on the carrier. We understand he is now prepared to undertake conversions, and on this account his device will interest motor cyclists.

Unusual Practice.

As will be seen from the drawing, the Barnes arrangement consists of a wheel frame, which is carried forward to a pivoting point in front of the engine.

upon the market. The Badger, however, is one of the few, and is intended as an ultra lightweight motor cycle, a combination of the motor-assisted pedal cycle and the pedal-assisted motor cycle. Its weight is 126 lb.—not an ultra-lightweight according to the English view, but in America, where 600 c.c. machines are termed lightweights, no doubt it is regarded as something particularly light. The engine has a bore and stroke of 62 and 56 mm. respectively, and is of the four-stroke tyne having an overhead

The engine has a bore and stroke of 62 and 56 mm. respectively, and is of the four-stroke type, having an overhead inlet valve. It is built up as a unit with the rear wheel, which is of slightly smaller diameter than the front wheel, and is contained in a detachable frame.

The wheel is carried in two side plates, which are also pivoted and carry vertical tubes enclosing coil springs. Telescoping over these tubes are others connected to a carrier member, which is stayed diagonally from the rear engine bolts.

diagonally from the rear engine bolts.

Our photograph depicts the converted Humber owned by Mr. Barnes, with a seat and pillion for tandem riding. The diagonal members from the hub to the winder tube of the frame are introduced only where the conversion is of a hub gear model. They form a guide for the change speed operating rod.

The spokes of this wheel are tubular, and altogether the machine gives one the impression that it is a composite, adapted from the main parts of the several pedal cycles which in America are built in imitation of the motor cycle, and a motor wheel of the Merkel type.

A GOOD BELT FASTENER

Although adjustable belt fasteners are not new, there are very few made these days, and there is no denying that they have very decided advantages, especially on countershaft machines, where lack of correct tension causes belt slip. With the R. and H. belt fastener the belt need not be removed to increase or decrease

Roberts and Hibbs's belt fastener.

the tension; a small "tommy bar" is inserted in a hole in the central screw member, and the belt is tightened or slackened as required. The fastener is instantly detachable, having a hook member screwed to one end of the belt. It is made in \$\frac{2}{4}\text{m.}\$, \$\frac{1}{4}\text{m.}\$, and 1in. sizes, and sells at 2s. complete. The makers are Messrs. Robert's and Fibrs, Euri-Street Works, Fanfield Road, Droylesing, Manchester, who, incidentally, make the New Scale-motor cycle.

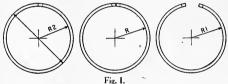

FITTING NEW PISTON RINGS.

SOME TECHNICAL CONSIDERATIONS. By H. George Harley.

HE proper designing of a piston ring is not such a simple operation as the simple form of the object may seem to suggest, and several points need to be taken into consideration when making rings to replace those of a different pattern if the best results are to be obtained.

The all-round best material for piston rings is cast iron, although the elasticity is not high; and, in order to keep the maximum stress in the ring as low as possible, it is important that the stress in the ring

when fitting over the piston is about equal to the stress when fitting into the cylinder bore. Now, if the ring is to be subjected to the least maximum stress, as mentioned above, it is obvious that the radius (r), fig. 1, of the ring when in a free position should be nearly a mean between the radius (r_1) of the ring when slipping over the piston and radius (r_2) of the ring when in position in the cylinder. The reason why the radius r is nearly a mean between the other two radii is that the maximum bending moment of the ring is opposite the cut, and, therefore, the ring, when expanded to slip over the piston, is not a true circle, but is rather elliptic in shape. Most motor mechanics have the knack of holding rings, while fitting on to the piston, in such a manner that the shape of the ring is as nearly circular as possible.

Eccentric Rings.

The point subjected to the greatest bending moment of a concentric ring is at the point opposite the cut; and, if the stress at this point is within safe limits, the stress at any other point in the ring must be well below the safe figure; nevertheless, the pressure of the ring on the cylinder wall, and the stress in the ring itself, are not uniform, and this is a disadvantage.

Some makers in this country, and a great many in America, use the eccentric type of ring (fig. 2), which gives a more uniform pressure and stress. This type of ring, however, can only approach uniformity, as the thickness at the ends would have to be infinitely thin to give absolute uniformity. Although the thickness at the ends cannot, of course, be reduced to nothing the more practical considerations will allow the thicl ness at the ends to be reduced, the nearer will th pressure and stress approach uniformity.

The reduction of the thickness of the ring at tl ends is limited to the minimum thickness which wi allow of maximum gas tightness, and the thickness. the point opposite the cut is limited by the figur denoting the maximum allowable stress of the rir when deflected; the ratio of the thickness of the fir opposite the cut to the thickness at the ends affect the degree of uniformity of pressure and stress whic may be attained.

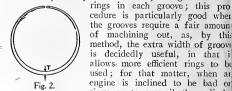

While it is true that the pressure upon the cylinde walls is more uniform than the thinner ends of th rings, it must be borne in mind that the ring mus not be reduced at the ends to such an extent that gas tightness is impaired.

Without question, eccentric rings properly designeare superior to the concentric type, and should b used if possible in cases where an engine is bein tuned up for best possible results.

Width of Ring.

Comparatively narrow rings are preferable to widrings in many respects; for instance, three rings mad-.1in. wide are much better than two rings made .15in wide. In repair work there is sometimes no option but to fit rings as wide as the rings previously fitted or even wider, when the grooves in the piston have been worn or machined out as a consequence of wear

If the grooves in the piston are fairly wide, good results may usually be obtained by fitting two narrow

cedure is particularly good when the grooves require a fair amoun of machining out, as, by this method, the extra width of groove is decidedly useful, in that i used; for that matter, when ar engine is inclined to be bad or rings or to over-oil the cylinder

or to have poor compression, it is worth while to fit two narrow rings in each groove in place of the original rings.

It is also advantageous to use narrow rings in a cylinder which has become worn unevenly, as the two narrow rings in each groove, being able to expand independently of each other, are better able to follow inequalities of surface, the one ring being expanded

Fitting New Piston Rings .--

into the worn part while the other ring is approach-

ing or leaving it.

It will be obvious at once that, if two rings are fitted in one groove, the joints of the ring can be placed diametrically opposite and will not be likely by any chance to coincide, with the result that the joint leakage will practically cease to exist.

The writer, after extensive tests of these rings, is of opinion that the advantages above mentioned are realised in practice, and that the use of two narrow rings in one groove is far preferable to the single rings of ordinary width, especially when tuning an engine up for any special event or service.

Gap in Ring.

When replacing broken or worn piston rings, information regarding the proper gap required is usually unobtainable; the consequence is that the amount of gap in the ring is the result of a guess

backed up by experience.

The gap made under these conditions is usually on the large size, and, although gas tightness may not be affected seriously when newly fitted, the life of the ring will be shortened owing to the gap reaching its maximum allowable size earlier; in fact, by making the gap over-size in the first instance, the ring is robbed of its period of most efficient service before it has been in service at all, and, for this reason, the gap should be the minimum safe dimension possible.

The ring when working reaches a temperature which lies between the maximum temperature reached by the piston top and the cooler walls of the cylinder and piston, the exact relation between these temperatures depending upon the individual design of

the engine and its conditions of working.

The expansion (e) of cast iron being .00000556 per unit length per degree Fahr., linear expansion of a ring

.00000556 T $d\pi$ (1)

in which T = temperature in degrees Fahr.

Assuming for a water-cooled engine a maximum ring temperature of 350° F. and substituting this for T in the formula, we get, after simplifying,

e = .0061d (2)

The gap should be slightly larger than is necessary to allow the ring to expand an amount equal to ϵ , equation (1), and in the case of diagonally slotted rings the angle of the slot has some effect upon the amount of gap allowable.

For a ring slotted at an angle of 45° the width of gap (g) allowed should be a little more than

g = e.7071.

Temperature of Air-cooled Engines.

In the case of air-cooled engines the cylinder is, of course, liable at times to attain a much higher temperature than in the case of water-cooled engines, and it may be safely assumed that the temperature difference between the cylinder and rings in an air-cooled engine is not likely to exceed the figure given for watercooled engines—in fact, the reverse is more probable; for this reason the figure given may be safely used for either air-cooled or water-cooled engines.

The following table gives the main dimensions of piston rings calculated according to the general considerations outlined above, the notation being the same as used in the text, e in the table should be increased by a slight amount equal to the minimum clearance

required while hot:

DIMENSIONS OF RINGS.

-	Concentric Rings.	Eccer Rin

MODERN SPRING FRAMES.

An Experience and the Moral to be drawn therefrom.

OR some months past I have been riding an experimental model fitted with an ingenious spring frame. Being rather an enthusiastic advocate of the simple machine, I embarked on this experiment with certain qualms, and my fears were not allayed by the remarks of certain of my friends who prophesied all kinds of troubles. For the first few weeks I had a feeling that the increase of comfort was too good to be true, and spent much time examining springs, joints, and bearings.

This feeling has now entirely disappeared, and I revel in the most comfortable motor cycle that it has yet been my lot to bestride. A daily journey which includes a stretch of villainous road surface is accomplished with such comfort that it requires a run on a rigid frame machine to make one realise the shocks which are caused by deep pot-holes. The machine in question is also particularly well sprung forward, and the combination of good forks and rear springing is almost ideal.

Makers of spring frames must pay attention to the forks, as comfortable rear suspension is apt to emphasise the faults of the spring forks to a surprising

degree.

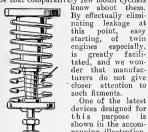

So far, no symptoms of side play have developed in any of the frame joints, but, should this occur, each point at which wear can take place is adjustable-a feature which shows the forethought of the designer, and one which is commended to others who may be contemplating spring frames. H.D.T.

EQUIPMENT FOR MOTOR CYCLES.

A Further Selection of Novelties for the Motor Cyclist's Needs.

To Prevent Air Leaks.

THERE are many devices for the pre-vention of air leaks through the inlet valve guide, and it is probably true that comparatively few motor cyclists

this purpose is shown in the accompanying illustration.
As will be seen, it consists of a flexible casing enclosing the valve stem, and comprised of an involute spring filled with graphite and having a washer top and bottom. It is manufactured by C. Pressland, The Sub.,

Hampton-on-Thames.

A Simple Spring Handle-bar.

This handle-bar possesses two brackets, one fastened to the headstock tube, to which is brazed or welded a fixed webbed bracket which serves as a mounting for the actuating spring. This bracket is split, and contains a semi-rotating bush provided with a bracket brazed on its dead centre, which passes through a slot in the head bracket. The bush is secured to the handle-bars by means of a clamp at each end, and drawn tightly by means of cotters and nuts. It is retained in the head bracket by means of a milled

locking nut. The two brackets are connected by means of a coil spring.

Spring handle-bars have been in vogue Spring handle-bars have been in vogue for many years, but for several reasons they have not caught the public fancy. However, in view of the rough roads encountered at the present time, there is little doubt that they will now receive electron the reason to the reason closer attention.

This patented handle-bar is made and sold by Messrs. W. E. Sleight and H. F. Robinson, 68, Bradford Avenue, Cleethorpes.

A Nest of Screwdrivers.

Messrs. Ramsay Brothers and Co., 245, Oxford Street, London, W.1, have lately placed upon the market a very useful tool, in the shape of a nest of small screwdrivers. The large screwdriver is

pocket, also when stored in the toolbag the sharp point cannot get damaged. In the body of the

screwdriver three other smaller ones are carried, the smallest being quite tiny enough for jewellers work, while the medium sizes should be invaluable when adjustments are required for such a delicate piece of mechanism as a magneto.

An Easily Fitted Sidecar Hood.

Those users of sidecars who are solicitous of the welfare of their passengers will be interested in a well-made sidecar hood, sold to fit any standard sidecar body, which is turned out by Messrs. James Grose, Ltd., 4, Old Jewry, Lon-don, E.C.1. It is quite well finished, and is constructed of the best waterproof tarill

Flexible Oil Pipe Connection.

There has also been placed on the market a flexible oil-pipe connection, a very useful adjunct, as it often saves the breakage of a pipe through vibration. These connections are made by Messrs. Grose, Ltd., and there is now no difficulty about delivery.

The Rimfix Inside Repair Band.

The Rimfix inside repair band is a novel form of gaiter, designed for use on the occasion of a bad burst. It is on the occasion of a bad burst. It is similar to the ordinary type of gaiter, except as regards its ends, which, as the illustration shows, provide a large over lap, so that the ends of the gaiter are folded right round the bead-ing of the tyre,

and each terminates in a rolled edge. By this means the gaiter to the rim by the beading, and the gaiter is then enabled adequately to fulfil the purpose for which it was in-

Rimfix repair band.

tended. It shows great promise, and should be a valuable item in the motor cyclist's tool-bag.

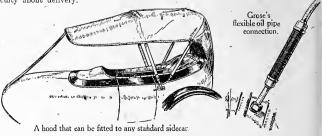

It is manufactured for the inventor, Mr. E. Barry, Milton, Portsmouth, by the Self-sealing Rubber Co., Ltd., Birmingham, and is sold in London by Messrs. A. W. Gamage, Ltd., Holborn,

The Leosco Tube Saver.

Although introduced in 1914, the Leosco tube saver is not so well known as it deserves to be.

The tube saver consists of a patent extensible band of red rubber and fabric, thick in the centre and tapered to the edges, and, on being stretched over the rim, the band beds firmly into the base. There it wards off the corrosion caused by wet and rust to the tube and to the beads of the cover; it prevents nipping and creeping; and it reduces the liability to punctures. It is marketed by Leo Swain and Co., 237-9, Deansgate, Manchester

Another article well worthy of the attention of motor cyclists, made by the above firm, is an inner tube so constructed that, before it is inflated, the inner portion turns back upon the onter; thus the whole tube lies in the outer part of the cover, and cannot be nipped be-tween the bead and the rim. This was tween the bead and the rim. This illustrated in The Motor Cycle December 4th, 1919, page 720.

THE BUMP BICYCLE.

An Oil Turbine to be adopted as an Auxiliary Power Unit for a Bicycle

IN The Motor Cycle of the 8th inst. there appeared a short article entitled "Why Fit an Engine?" This has brought forth particulars of a unique brought forth particulars of a unique machine, in which any kind of unused energy is employed to drive it. The inventor of the Bump bicycle, as it is ealled, has adopted a different system from our French friend.

proper is fitted, but his is an attempt to make use of the waste energy caused by the action of the saddle to assist the by the action of the sadue to assist the rider in propelling the machine. The Bump is in no sense a motor bicycle as we understand it, but is intended to be a motor-assisted bicycle, concerning which we are enabled to publish the following preliminary details.

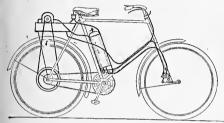

There is a cylinder attached to the saddle tube of the bicycle, provided with an ordinary tyre valve at the top. Air is pumped into this by means of an ordinary bicycle pump to a pres-sure of about 15 lb. to the square inch. The lower portion of the cylinder contains oil, on which a float rests, thus separating the oil from the air chambers. The pump is attached to the back of the saddle, and is operated by the saddle moving up and down,

owing to ordinary undulations in the road. It serves to pump the oil from the small reservoir over the rear wheel the exhaust chamber, as it were-to the large reservoir, which in turn delivers it to a small Pelton wheel. This is situated on the top of the oil tank. The power is conveyed to the rear wheel by means of a chain, and the flow of oil is controlled by a lever on the handle-bars. Similar pumps can also be attached to the front forks when these are sprung.

The machine has not yet been manufactured, but we understand that the first model will be on the road in about a fortnight's time. It is handled by Central Traction, Ltd., 125, Wool Exchange, London, E.C., and the inventor is Mr. A. E. Steel.

We may say we have received quite a number of letters regarding this invention, and in our correspondence columns last week there was shown a ketch by a reader, who goes so far as to imagine a hill-climb for riders of such machines.

No engine

The Bump bicycle, to which is fitted an auxiliary motor in the form of a wheel.

A RACY CYCLE CAR.

A Small Four-wheeler which may Appeal to the Sporting Soloist.

NEW cycle ear, possessing a very A New cycle ear, possessing a very racy appearance, which can be used either as a monocar or a tandem two-seater, will shortly be placed on the market by Messrs. Herrtage, Holyoake and Company, 127a, Fleet Street, London, E.C.4.

Mr. Earl, of Earls, Ltd., Hampstead, London, N.W., is responsible for the design, which incorporates a Coventry Victor flat twin engine, housed beneath the removable bonnet, at the forward end of which is a dummy radiator, the

The front axle and spring on the Earl cycle car.

water tubes being replaced by metal slats arranged horizontally. The drive from the engine is transmitted through a three-plate clutch by a propeller-shaft to a countershaft gear box, containing bevel gears. The drive from the countershaft to the live rear axle is by two roller chains, engagement of the two

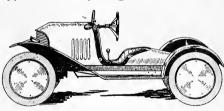

forward speeds being by means of dogs on the countershaft. A re-The forward gear ratios are 5 and 8 to 1, whilst the reverse gear, which is actuated by a separate lever, gives a ratio of 9 to 1.

Two brakes are provided, foot and handoperated respectively, and consist of external brake bands contracting on drums mounted

on each rear wheel.

The chassis is of ash, strengthened by flitch plates, and laterally held by angle iron cross members. The rear springing is of the conventional quarter-elliptic type, is of the conventional quarter-entitie type, whilst at the front a single-point suspension is used, the front axle being suspended in the centre on a single volute spring, whilst the ring in which it reciprocates is pivoted to the front end of the chassis, in order that the wheels may ride at any angle whilst the chassis remains horizontal. Steering is by cable and bobbin in conjunction with a telescopic steering column of novel design to facilitate entry into the single seat. The eables from the bobbin are conducted to the front-axle through heavy gauge Bowden casing. An adjust-able seat is provided, and the movable tail, fixed directly at the rear, can be removed to accommodate a passenger.

The simple bodywork should permit the price to be comparatively low, for usually the body of a car costs a large percentage of the chassis price, and is

A cycle car of simple design-the Earl fitted with flat twin engine.

therefore the most expensive item in a specification. No doubt there are quite a number of sporting motor cyclists who would favour such a machine as the Earl promises to be.

A HINT FOR COLD WEATHER

Utilising an odd sock to enclose the top half of lighting generator and prevent the swater freezing on a frosty night

A Simple Miniature with Spring Frame.

The Macklum Scooter, with a Simple Pressed Steel Frame and Springing System.

THERE is no gainsaying that a very certain demand exists for a type of machine different in many respects from the conventional form of motor cycle. Ten years ago we urged manufacturers to give more serious thought to the open frame machine to meet this demand. have also advocated lighter lightweights, does come it will open up a vast fieldhitherto untouched by present types— which consists of potential buyers of handy little mounts, with which the use of special clothing will not be necessary.

A new scooter which interested us as an

embryo open frame motor cycle is the Macklum, the design of Mr. F. MacCallum, of Guildhall Buildings, Birmingham, which embodies a spring frame of novel

Wide Power-weight Ratio.

witness the presentation to the A.C.U. of The Motor Cycle Trophy for a 250 c.c. class in the Junior T.T. race. Sooner or later the lightweight open frame machine will come. Of this we are convinced; will come. Of this we are considered more convinced now perhaps than before the reintroduction of the motor scooter during the past twelve months. When it

engine

A single pressing, lorming the rear guard, platform, and "chassis" of the Macklum

order to provide a very large reserve of power to enable the machine to climb any ordinary hill-on a single gear, but modifications in this respect may be made to suit different requirements.

As will be seen from the illustration, the engine is carried above the front wheel, with which it forms a unit with the front forks, etc. These latter are of stamped steel, as are also the stays supporting the engine. The transmission is by chain, and the wheels are 16 x 2in.

A One-piece Frame.

More interesting, however, is the frame design, if frame it may be called. Simplicity is its keynote, which will be appreciated when it is known that the rear mudguard, platform, and "chassis" will be a one-piece stamping. In the

experimental model, however, this has been built up, but we are reviewing the design rather than the actual machine as it exists at present.

From the diagrammatic sketch of the springing system it will be seen that the back wheel frame is pivoted at the rearend of the pressing at that point where it forms the tail end of the mudguard.

At the forward end the wheel frame is connected to one end of a half-elliptic laminated spring which is fixed to the "chassis" at its centre.

The front portion of the machine (i.e., the steering head and fork, engine; etc.), is connected pivotally to the main frame by means of a dupley triangulated. by means of a duplex triangulated structure of which the top and the hottom of the steering head form two points of the triangle. Between these points is a lug upon which pivots a tube which passes through a slot in the platform and is connected to the fore end of the spring.

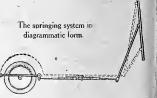

A demonstration of the machine on the road gave ample evidence of the efficiency of the frame design, which is patented in most countries, and we await with interest further developments in the form of a machine which will have the same extended scope as a motor cycle.

Accommodation;

In the meantime, Mr. MacCallum is exhibiting at the Birmingham Industrial Fair next month to test the possible demand, both in this and other countries, for his machine as a seat type scooter on the lines of the machine illustrated, which, it will be seen, is fitted with a box for the carriage of parcels and a Tan Sad seat

to accommodate the driver.

The experimental model was built throughout by Messrs. Alfred Wiseman, Ltd., the manufacturers of the Verus motor cycle, under the supervision of Mr. T. Weaver, the Verus works manager and a keen competition rider. The machine was produced in less than a month.

A LUBRICATOR FOR BOWDEN CABLES.

W E recently inspected, at the works of Mr. Leopold Ward, experimental engineer, Harmood Place, Chalk Farm, London, N.W.1, an in-genius device he has made for an in-ventor for the purpose of lubricating Bowden cables. The triangular box, through which the cable passes, is filled with grease, and extra grease is forced in from time to time by means of the grease cup shown in the illustration.

An excellent device for keeping Bowden cable in good condition.

The reciprocating movement of the wires and the pressure exerted through the grease cup cause the lubricant to pass throughout the length of the controls, throughout the length of the countries, thus keeping them in good order and preventing any likelihood of breakage or wear. Undoubtedly cable breakages are frequently due to lack of lubrication, and such a device might find favour with those who desire to add every refinement to their machine.

The Mepward two-stroke scooter engine of 116 c.c.

The crank case and cylinder Note the ports in the cylinder barrel.

THE promises of increased production of motor scooters are very apparent. I of motor scooters are very apparent. Each week a newcomer, incorporating advanced designs, joins the ranks of the producers of the miniature motor cycle. An experienced and enterprising firm, Messrs. Mepsted and Hayward, 52, Rodney Street, Pentonville, London, N.1. has recently placed on the market an interesting little power unit possessing many of the features which render it suitable for adaptation to motor scooters. Two models are made, one of which is

constructed primarily for attachment to

pedal cycles.

The scooter engine, which is of the two-stroke two-port type, has very small external dimensions. The latest pattern Fellows magneto is fitted, the miniature size of which is in keeping with the remainder of the engine, and this can be mounted in different positions around the crank case. A steel cylinder is used, having a bore and stroke of 54 x 51 mm. (116 c.c), which being cut from the solid, enables the walls, ports, and fins to be

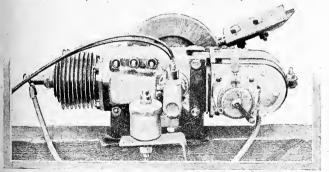

machined to more exact dimensions than when a casting is used. The cylinder is let into an extension of the crank case to a point beyond the ports. The crank case is an aluminium casting, the flywheel side of which receives a plate the nywheel side of which receives a plate which acts as a support for the magneto platform, and forms one of the main bearings. On the other side of the crank case a phosphor bronze bush is located in the casting and supports the other end of the nickel steel crankshaft. Ribs (not the mickel steel crankshatt. Ribs (not shown in the photograph) are cast in the exhaust port (formed in the crank case extension mentioned above) to assist the dispersal of heat, whilst the inlet port is provided with a diaphragm valve, which latter and the crank case are covered by natents.

Lubrication is on the petroil system. A petrol tank, however, is not included in the outfit, as the disposition of the engine necessitates many variations in design. Steel stampings are used both the control of the c

for the connecting rod and flywheel.

The second model, suitable for pedal cycles, is similar in construction to the eyotes, is similar in construction of the socoter engine, with the exception of the position and method of mounting the magneto. In this case it is held by spring bands to the bottom of the crank case, which latter differs from the first design, incremels a both real beauting are made inasmuch as both main bearings are made integral with the casting, whilst one side is held to the remainder of the crank case by means of bolts.

The Mepward power unit, as designed for use on a pedal bicycle.

PETROL TO BE DEARER?

THE daily press during last week succeeded in creating such a scare as circles. Petrol prices were to be increased by as much as 8d. per gallon, we were to be shamelessly fleeced, and,

in fact, all was lost.

But is the price of petrol going up? Who knows? Certainly not the ournalists who created the scare. At journalists who created the scare. At the time of writing nothing whatever has been decided by the oil importers. No joint meeting of the representatives of the various petrol companies has been convened to discuss the matter, and, though a "lightning" decision may be made at any moment, the probability is that there will be no increase in the immediate future. mediate future.

If a rise is decided upon it will be excused, almost certainly, by the importers on the score of high sea freight rates and the increased railway goods rates, the last-named being raised by 60% on consignments weighing less than three tons, and by 50% on heavier consignments, while the rate for "empties"

So far as sea freight rates are concerned, it is difficult to get at the true facts, for the oil companies own most of the tankers, and can establish any rates

the tankers, and can establish any rates they like, the precise figures being merely book-keeping entries. The outstanding fact is that a cargo of petrol can be purchased f.o.b. New York at approximately 1s. 2d. per gallon, and it is sold in England at 3s. 04d. per

gallon. There is an import duty of 6d. per gallon to be paid to the British Government, so that a cargo bought f.o.b. New York at 1s. 2d. would cost landed in England 1s. 8d. per gallon, and to that figure must be added the value of freight and insurance. Also, we must add the retailer's profit of 4½d. per gallon and the cost of distributing the petrol from the depots to the garages. Figures for that item and sea freight are kept secret. The guestion at the moment is, taking

The question at the moment is, taking 2s, 0½d, as the cost of petrol in England, after the import duty and the retailer's profit have been paid, is not 1s, a gallon ample to provide for freight, insurance, and distribution? We trust that the Preference Committee will be able the Profiteering Committee will be able to solve the riddle.

Times to Light Lamps.

GREENWICH TIME

A Race for Tanks.

It is proposed to hold a race for French tanks at Lyons next March. The military approval is being sought, and, if obtained, the Automobile Club du Rhône will select a course in the neighbourhood where natural obstacles abound. All types of tanks used in the French Army will be eligible to compete. L'Auto also announces a "cross-country" for tanks, to take place some time this year in the neighbourhood of Paris.

Broken Glass on Roads.

The recent offer by the Automobile Association of a reward of one guinea for evidence leading to the conviction of persons wilfully placing broken glass or other destructive materials on the highways has brought good results. Among the cases reported was one by a police the cases reported was one by a police constable, who has received the promised reward. In this case the constable saw the delinquent, who was subsequently fined, deliberately take a bottle from his pocket and smash it on the roadway.

The A.A. road patrols have reported the use of granite chippings, cinder ashes containing glass, and other tyre-destroy-ing road dressings by local authorities. The authorities concerned have invariably taken the necessary action for stopping the practice when informed of the dangerous practice.

The Trade and Competitions.

The Motor Cycle Manufacturers' Section of the Cycle and Motor Cycle Manufacturers' Union has had under consideration the question of trade sup-port to open competitions during 1920, and has decided to raise no objection to members supporting any of the twenty open competitions which are receiving licences from the A.C.U. if they feel so disposed.

The Section also decided to accord permission to manufacturers desiring to enter any of the four events promoted by the A.C.U., namely:

1. Tourist Trophy Races.

Six Days Trial.

Trial for Three-wheeled Cars.

Trial for Scooters.

The approval of the Competitions Conmittee is required to the rules and regulations governing the various competitions of 1920.

News from France.

At the hill-climb held by the Nice Motor Cycle Club on Mont Chauve the motor bicycle class was won by a B.S.A., with a Peugeot second and J.A.P. third. Among the sidecars an Indian was the Anong the steedars an Indian was the winner in the 1,000 c.c. class, a Motosacche in the 500 c.c., and a Clyno in the 750 c.c. class, with a B.S.A. second and Moto-Rève third. We understand that French makers are behind time in the production of your worlds. production of new models.

H. R. Davies Still a Motor Cyclist.

H. R. Davies, who tied for second place in the last Senior T.T. race on a 3½ h.p. Sunbeam, has now been demobilised, and will re-enter the competition field in earnest this year. He has joined Messrs. Amac, Ltd., and will enter most of the important events, including the T.T. Davies has a creditable war record. He joined as a D.R. in October, 1914, and went straight to France, where he remained until December, 1915, returning home for his commission in the R.E. He was transferred to the R.F.C. in June, 1916, acting as pilot for several months over "the lines." He was eventually shot down and reported missing for some time, but it transpired that he was a prisoner in Germany, where he remained for twenty months, and was repatriated about a month after the Armistice.

H. R. Davies, the well-known pre-war T.T. and competition rider, who has now re-joined the motor cycle trade after five years in the R.E. and R.A.F.

Special Features.

THE PERFECTLY FITTED MOTOR CYCLE. ACETYLENE LIGHTING. FITTING NEW PISTON RINGS.

The Junior T.T. 250 c.c. Class.

There is no doubt that this year's T.T. There is no doubt that this year s T.I. will receive support from every manufacturer who is in a position to build suitable machines for the races, but the moulders' strike has already ruled out several firms who would have competed had labour difficulties' been less acute. Several makers have signified their intention to enter, and amongst the entrants may be enter, and amongst the entrants may be mentioned the Levis and Cedos, both of which makes will probably be represented by several machines in the 250 c.c. class for *The Motor Oyele* trophy, as will the makers of the O.K. lightweight.

The Research Association of British Motor and Allied Manufacturers, Ltd.

Negotiations have for some time past been carried on between the Government Department of Scientific and Industrial Department of Scienting and Industrial Research and the Association of British Motor and Allied Manufacturers with the result that the Research Association of the British Motor and Allied Manufacturers has been formed under conditions entitling it to substantial financial assistance from the Government. The movement, too, is receiving influential support from within the industry.

The activities of the Association will fall under two headings: the collection

and dissemination of scientific information of value to the industry, and actual research and experiment.

Motor Cycle and Sidecar v. Train.

On a recent morning we left a certain village rather over twenty-five miles from London on a 4 h.p. single cylinder and London on a 4 h.p. single cylinder and sidecar, carrying a twelve-stone passenger. Just on the outskirts of the village we passed a colleague who was on his way to catch a train leaving at 8.31. We were, perhaps, seven minutes in front of the train. One stop was made during the journey, and a further stop was made in the outskirts of London to deposit our passenger. The colleague, was made in the dustries of London to deposit our passenger. The colleague, who travelled up by train, reached faringdon Street Station at exactly the same time as ourselves, and we drove him from there to The Motor Cycle Offices in Tudor Street. This is rather an interesting performance, as it shows that a journey from door to door can be accom-plished more quickly by motor cycle than by train, even though the said train touches fifty miles an hour, and only stops once between the starting point and the Metropolis.

MOTOR (YCLE

North-Eastern A.A. and the Six Days.

A meeting of the Motor Cycle Board of the North-Eastern Automobile Association was held at Newcastle on January 13th, when Mr. Q. A. Nicol, O.B.E., presided, and there was a representative attendance.

Over a dozen possible routes for the A.C.U.'s Six Days Trial, next July or August, were submitted, and ultimately accepted, in order to be forwarded to if more severe routes were desired, the Board would be prepared to submit another scheme with some other centre than Newcastle.

It was decided to delete from the rules of the Board all reference to distinctions between amateurs and professionals, and to allow the general rules of the N.E.A.A. to govern the situation.

The Motor Cycling Club.

The annual general meeting of the Motor Cycling Club will be held at 6.30 p.m., at Paganni's Restaurant, on Wed-

p.m., at Paganni's Restaurant, on Wednesday, January 28th.

The openmg run, following pre-war practice, will be to the Old Ship Hotel, Brighton, on Saturday, March 13th. Dinner will be served at 7 p.m., after which the medals won in the London-Exeter run will be distributed. Mr. W. H. Wells will be in charge of the arrangements Those members who desire accommodation should write to him, c/o The Hendee Manufacturing Co., Ltd., 366, Euston Road, London, N.W.I. Saturday, June 26th, has been definitely fixed as the date of the M.C.C. Inter-Team Trial for The Motor Cycle

Inter-Team Trial for The Motor Cycle 50 Guinea Challenge Cup.

Rolls-Royce Workers' Welfare.

The twelfth annual general meeting of Rolls-Royce, Ltd., takes place on the 23rd iust., when the directors' report will be presented. After providing for all charges, a uet profit of £153,261 has resulted, and a 10% dividend having been paid it is proposed that one-half of the

surplus profits above that amount be devoted to a works welfare scheme. The fund thus created will be expended in houses, recreation grounds, and other matters appertaining to the betterment of the social life of the employees of the company. It is also proposed that a

Foulhoux (-

C11

FEW years ago sidecar machines with engines of very small capacity were considered by some to be the ideal outfit for the lady driver. These have now almost disappeared, and quite rightly too, for, in the scales of continued and efficient

Lack of Power in Sidecar Outlits. The Ultra Lightweight for Ladies' Use.

By MAY WALKER

service, they would generally be "found wanting." The two-stroke engine—with which such machines are usually fitted -is essentially the engine for a light solo mount; such machines provide an enjoyable means of travelling for one

person with far greater comfort and less cost than the railway.

Doubtless when manufacturers are in a better position to cope with the unusual demand for motor cycles, we shall find light machines listed that can be used as miniature passenger outfits. The sidecar may be light and attractive, but, unless the engine is up to 3½ h.p., I would strongly advise the lady motor cyclist to resist its appeal.

I have travelled far and wide during the last twelve months, and have been surprised to notice how few lady motor cyclists are riding in the Midlands. This being the home of the motor industry, one expects to find many women awheel, but I encountered many more "down south." Probably this is due to the lack of machines specially designed for ladies' use. In this direction manufacturers appear to ignore what must

This machine has proved an admirable outfit for a lady to handle where power is needed Its two-speed gear is probably the simplest type fitted to a powerful mount

Through Feminine Goggles .-

be a very certain demand both for the solo and the sidecar types of machine.

Wanted-a Simple Lightweight.

For a solo machine, the question is how low can one keep the power and consequently the weight and yet obtain a mount that is fully capable of carrying one person up all main road gradients? I remember a 14 h.p. Little Giant that I owned round about 1912. It had many faults, but not unreasonable ones. I feel sure, with latter day knowledge concerning small engines and scientific frame design, the British industry could now produce such a machine to be in every way reliable. Not only do ladies-but a large number of men also-require an ultra-lightweight machine, and perhaps the introduction of a 250 c.c. class in this year's T.T. Race may be the means of bringing the real lightweight machine forward. In the meantime such a machine as the Levis Popular is a sound investment for the lady who looks for efficiency without the extra weight in the way of gears and such extras. These machines are exceedingly simple, easy to ride, and light to handle. They are usually made with diamond frames only, but the 24in, wheels and saddle position are low enough for even a small woman. There is no need for ungainliness in mounting, while the controls are so few that the novice can easily acquire the necessary knowledge to master them.

A Novices Long Journey.

We all know how the Levis performed in expert hands during last year's trials, but a fact that seems to me to portray greater reliability is that a young girl of my acquaintance undertook, and successfully carried out, a journey of some two or three hundred miles without knowing the sparking plug from the belt fastener.

belt fastener.

I do not believe in asking a machine of this power to carry an extra passenger. Not because it would be incapable of it, but because the practice, if not

dangerous, is most uncomfortable. We have heard much of the driver's views on pillion riding, but we rarely hear the pillion rider's ideas on the subject. I am quite certain that members of my own sex who have tasted the comfort of a modern sidecar, or any sidecar, would infinitely prefer it to being joited and bumped above the unsprung back wheel. The man who asks a lady to pretend to enjoy this mode of travelling, when a sidecar is obtainable at a little cost, is sacrificing his fair companion's comfort to his own preference for a solo machine. There are ages and stages when one can enjoy the most crude forms of pleasure—one recalls the seesaws of one's youth—but tastes change.

A 6 h.p. Sidecar.

A contrast in types is afforded by the 6 h.p. Enfield combination. One does not ask what the engine can do. It has all the power that reasonable managements. It is fitted with a most comfortable and well sprung sidecar, and the brakes are better than those on many makes. When the manufacturers have had time to look round, perhaps they will give us a niche in which to fit the petrol can to save strapping and unstrapping when the tank requires replenishing, also a nice aluminium locker permanently fitted to the back grid large enough to hold the luggage necessary for a holiday. Of course, the grid should be sprung with the body, and then we can pack our luggage without fear of damaging the body.

TAXATION.

Increased Molor Cycle Taxation is Threatened, and it is Practically Certain that the Fuel Tax will not be Retained. Below are given Several Alternatives.

HE vital question of taxation is discussed in *The Autocar* of January 10th, from which it would appear that the difficulties of collection are likely to put the fuel tax scheme out of court. This leaves us with the alternatives of a direct tax on each vehicle on existing lines. It is likely that this tax will be increased, so that the question of horse-power rating formula is of the greatest importance.

In spite of its disadvantages, The Autocar is inclined to agree that the present Treasury rating should be retained for cars, in view of the possibility of even

more unsuitable formulæ coming into use.

So far as motor cycles are concerned, it is satisfactory to know that motor cyclists are capably represented on the Motor Legislation Committee, which is acting in an advisory capacity to the Government; and, if one goes into the question thoroughly, it must be appreciated that such representation is very necessary, as. it does not follow that a satisfactory formula for car taxation would be equally satisfactory for motor cycles. As far back as 1913 we ventilated this question when the Treasury was before considering the revision of motor cycle taxes. We showed how absurd the present car formula would be when applied to motor cycles, as was suggested. In fact, it was largely due to these examples of anomalies and a Motor Cycle petition that the idea was dropped.

We repeat some of these below:

					£s	. d	i.	
6 h.p. twin	motor c	vcle		 	4 1	4	6	
8 h.p. twin l					4	4	0	
4 h.p. four				 	4 1	4	6	
7-8 h.p. four	-cvlinde	r F.N.		 	4.1	4	6	
3 h.p. singl	e			 	2	2	0	
23 h.p. twin			'	 	3	3	0	

According to *The Autocar*, the final selection of modes of taxation will probably lie between:

A.—Taxation by unit of horse-power (formula).

B.—Taxation by unit of cubic capacity.

C.—Compound tax.

Taxation by Cubic Capacity.

The first-mentioned will bring up the old question of horse-power formula, for it is obvious that, if bore alone is taken, as in the present car rating formula, it will not be fair to motor cycles. The second—taxation by unit of cubic capacity—has many pitfalls; and the last means abolishing the present petrol tax, and compounding it with either A or B on an assumed petrol consumption, say, for 5,000 miles annual running.

We have already shown some of the anomalies obtaining where the present Treasury rating for cars is used, and, therefore, if a horse-power rating is used, it will have to be different from the one now in use, stroke being taken into consideration. In this connection a simple unit to use would be for 125 c.c. to be regarded as I h.p. It is a formula which may be regarded as giving actual power quite as accurately as any other formulæ can give, and has the advantage of also covering the second suggestion.

If such a unit were used for both cars and motor

cycles, and we assume a tax of 5s. per horse-power, we get the following results:

 125 c.c.
 ...
 5s.
 500 c.c.
 ...
 20s.
 875 c.c.
 ...
 35s.

 250 c.c.
 ...
 10s.
 625 c.c.
 ...
 25s.
 1,000 c.c.
 ...
 40s.

 375 c.c.
 ...
 15s.
 750 c.c.
 ...
 30s.

It is clear at a glance that such a unit for cars would not be satisfactory to the Treasury Department, which at present derives a greater revenue from the present rating, of which the following are a few examples:

 Singer (1,097 c.c.)
 ...
 65s.
 2,000 c.c.
 ...
 84s.

 A.V. (961 c.c.)
 ...
 65s.
 3,000 c.c.
 ...
 126s.

 1,500 c.c.
 ...
 ...
 65s.
 ...
 ...
 ...

From the above, it would seem that any attempt to adjust present car formula with the intention of embracing motor cycles will be very hard upon the latter, because even the basis of present rating makes a 100 c.c. unit approximately 6s.

On this basis, motor cycle taxes would be as follows:

It will be appreciated that such taxes, in addition to a petrol tax, would make motor cycles very expensive; and, while it is understood that motor cyclists will have to pay an increased rate of taxation, the cubic capacity unit is not altogether ideal if the same rate is to apply to cars.

Effect of a Compound Tax.

There is one more system which may be suggested, and this is that the basis be one of weight and include the present petrol tax. If such should be adopted, it cannot be expected that very small units will be used—motor cycles may even be divided into two, or at most three, classes, say 200 lb., 500 lb., and over 500 lb.

To appreciate fully the effects of this system, the present taxes should first be considered.

 Approx.
 Tax on Veight.
 Tax on Veight.
 Tax on Veight.
 Total.

 572 lb.
 Sidecar, 50 m.p.g.
 £1
 £2 l0s.
 £3 l0s.

 300 lb.
 Solo, 75 m.p.g.
 £1
 £1 l3s.
 £2 l3s.

 196 lb.
 Solo, 100 m.p.g.
 £1
 £1 st.
 £2 2 ss.

From the above it will be observed that a new inclusive tax of £2 for machines of 200 lb. or under, £2 ros. for those between 200 and 500 lb., and £3 ros. for the over 500 lb. class, which would cover practically all sidecars, would be in keeping with present-day taxation, when a motor cyclist rides 5,000 miles during the year. True, many exceed this figure; on the other hand, there are a large number who do not reach it, so it may be taken as a fair average.

It is agreed that motor cyclists must pay their share towards the upkeep of the roads, and, so long as this share is in proportion to the weight and power of their machines, no fair-minded rider will object to paying such apparently large sums. What he will object to will be a formula by which he may be called upon to pay as much as or more than the owner of a machine weighing perhaps double the weight of his own.

Essex M.C. Annual Dinner.

The fifteenth anniversary of the Essex d.C. was celebrated by a dinner at the testaurant Frascati on Saturday last.

An Earlsfield (S.W.) Club?

It is proposed to form a motor cycle lub for Earlsfield district, and any motor yelist in the locality, or adjacent thereo, wishing to join should communicate with the secretary (pro tem.) at 20, Valdron Road, Earlsfield, S.W.18.

South Birmingham M.C.C.

The annual dinner and prize distribu-ion was held on Friday evening at the Vhite Horse Hotel, Congreve Street. 'he attendance, which was large, inluded many prominent motor cyclists nd representatives of the trade.

North Wilts M.C. and L.C.C.

An enthusiastic meeting was held on he 14th inst., when it was decided to orm a Motor Cycle and Light Car Club nder the above name. Preliminary deails were discussed, and a temporary hairman and secretary appointed.

A further meeting will be held on Wedesday, January 28th, at 8 p.m., at ay's Restaurant (side entrance), Wood treet, Swindon.

The secretary (pro tem.) is Mr. A. R. Vorris, 26, Kent Road, Swindon.

Surbiton and District M.C.C.

At a meeting held at the Fox and lounds Hotel, Surbiton, on the 14th inst., was unanimously decided to form the club. About sixty prospective iembers were present.

It has been decided to call the first unual general meeting to take place on r about January 28th at more commodious uarters to elect officials, arrange competilons and social functions for the coming

ason, and to elect members.

Mr. W. B. Reeve, of 25, Ditton Road, urbiton, who was elected hon. sec. ro tem. will be pleased to hear from my motor cyclist or light car owner who interested. interested.

N.M.C.F.U. (Rotherham).

A very successful meeting of members f the N.M.C.F.U. was held in the .M.C.A. Rooms, Rotherham; on Saturay, the 17th inst. It was agreed unani-nously to form a branch of the I.M.C.F.U. in Rotherham, a provisional ommittee being appointed, with Mr. C. krown. "Glencroft," Deepdale Road, totherham, as convenor, and a further teeting arranged for Friday, the 30th 1st., in the Y.M.C.A. Rooms, Rotherham, commence at 7.30 p.m., to elect officers nd arrange a programme for the 1920 in son

Skewen M.C.C.

A motor cycle club has recently been formed at Skewen, Glam., and the opening run will take place on Saturday, the 31st, at 3 p.m., from the Harp Hotel (weather permitting). The secretary protein. is Mr. Joseph Evans, 14, Newall Road, Skewen, near Neath.

Exeter M.C. and J.C.C.

The committee of this club, having decided to assume the responsibilities of the 1914 committee, will be glad if persons having claims against the club for prizes won in competitions prior to the war will communicate with the hon. secretary (Air. T. J. Mooney. The Wessex Garage, Exeter) on or before January 30th. The committee will not hold itself responsible for claims made after this date

Liverpool M.C.

The following alterations have been made to the provisional results of the made to the provisional results of the above-mentioned trial, published in October, 1919: J. A. Newman [3½ Sunbeam), 102 marks. Reliance cup. Noel H. Brown [7-9 Indian sc.), received 101 marks. T. Weaver [2½ Verus), received 90 marks, and is therefore awarded a silver medal.

Nottingham and District M.C.C.

A reunion dinner has been arranged at the Albert Hotel, Derby Road, on Friday, February 6th, at 7 p.m., to which ladies are cordially invited. The tickets are 10s, each.

Members requiring tickets are requested to apply, at once, to Mr. J. Simmonds, hon, secretary, 10, Cranmer street, Nottingham.

Birmingham M.C.C.

The annual dinner and prize distribution of the Birmingham M.C.C. will take place on Saturday, the 24th inst., at 6 p.m. It is to be held at the Queen's Hotel. An excellently arranged list, in tabular form, of awards gained in the 1919 competitions has been prepared.

Sutton Coldfield and North Birmingham A.C.

The Sutton Coldfield A.C. have now incorporated the North Birmingham Motor Cycle Club, and in future the combination will be known as the Sutton combination will be known as the Sutton Coldfield and North Birmingham A.C. The club will hold the Colmore Cup Reliability Trial on Saturday, February 28th. All particulars may be obtained from Mr. Phil. Mosedale, The Nook, Maney Hill Road, Sutton Coldfield.

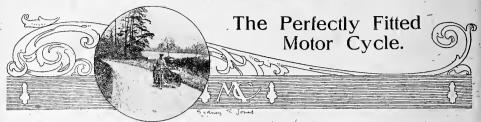

Dublin and District M.C.C.

The Dublin District and Motor Cycle Club have elected Mr. N. E. Drury as president for the coming season. Mr. Drury has recently been demobilised after a lengthy term of service with the Forces, having served with the "Dublins" in Gallipoli and Serbia. Mr. W. H. Freeman will again act as hon. sec., and the committee has been strengthened by the addition of several new names. Although the club will not have the distinction of running any of the open events recognised by the trade—the only recognised Irish event being the End-to-end. which will be run under the auspices of the Ulster centre of the Union-they have issued a very comprehensive competition programme, which includes no lewer than thirteen events.

Amaigamation of Clubs.

The proposed amalgamation of the Burnley and Preston Motor Cycling Clubs with the Blackburn and District Club was carried a step further at a recent meeting of the latter organisation, when it was decided to change the name of the Blackburn Club to that of the East Lancashire Motor Cycling Club. The area of the club's tuture activities will thus be considerably extended, and will embrace all districts from and including Colne, Nelson, Burnley, Accrington, and Haslingden, and the Rossendale Valley, on the one hand, and Darwen, Chorley, Ormskirk, Leyland, Preston, Blackpool, and Lancaster, on the other. Motor cyclists beyond this area will also be eligible for membership. It was further decided to make representations to the Bolton club, with a view to their inclusion, and to have conferences with representatives of the Burnley and Preston clubs in regard to the scheme.

A Plea for Symmery of Design and Enclosure of Details.

ROM an accessory standpoint, most riders have two principal complaints to make against modern machines. It is the easiest thing in the world to equip a machine with first-class accessories, all of them reliable, and all of them thoroughly welldesigned to suit the purpose they have in view. On the other hand, the day of perfection is not yet. After an outlay of up to £200 on the naked machine,. further investments are necessary to make the mount ready for the road, and this secondary outlay may reach as high a figure as £15. Secondly, when the purchasing process is complete, the machine bristles like a heap of spillikins. It has probably lost any symmetry or beauty of outline with which its designer originally endowed it; the difficulty of cleaning it and its liability to rust have been greatly enhanced. Neither objection is of a fundamental character: the first is financial, the second is mainly æsthetic; but the perfect motor cycle will be-free from them both; and they are worthy of attention.

Moreover, the time has evidently come when such matters must enter on a new phase, for two novel factors have arisen. Until 1919, every buyer of a motor cycle bought a lamp and hooter immediately after his machine was delivered; and in many cases he added a speedometer as well. At the 1919 Show, many of the exhibits included all these items in their specification, and, by the 1920 Show, this innovation may have become standard practice (bulb horns will no longer survive on electrically-equipped machines). From this single innovation it follows that in future designers will plan a layout which includes the bulkiest accessories; and there is no reason why they should not aim at a cleanliness of outline of which we have not yet dreamt.

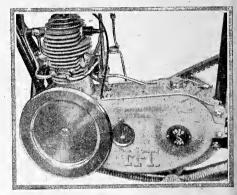

Cleanliness of Design.

A second factor may be added. An influx of new blood is jerking motor cycle design out of the groove into which it had tumbled. Should the motor cycle factories decrease in number and increase in size, they will attract engineers from the motor car industry; and in that industry cleanliness of design is a high spot at present-so high that it is sought after where it is of comparatively small importance, e.g., under a bonnet, protected from dirt. On a motor cycle, spiky design has a profound effect on the rider's happiness. .All the spiky portions of a car's exterior are being cleaned up; discs conceal the spokes; valances cover up the springs and brake rods; the control levers have vanished into the interior of the body: the running boards are being cleared of boxes. A casual glance through the illustrations in any issue of *The Motor Cycle* suggests that motor cycles stand in far more urgent need of such treatment; there is not a machine on the road which is not an appalling dirt and rust trap.

Hence completely equipped machines with a clean, smooth exterior are bound to come. They would have been with us already had the Italian industry reached an advanced stage; for the Italian engineer is an artist even when he is most practical.

A Smooth Outline.

The cleaning up process must, of course, be applied to the "chassis" before there is any great point in applying it to the equipment. The wheels, the front fork, the crank case, the gear box, the cylinder, the carburetter, and the magneto installation are at present honeycombed with chinks and crannies. Until these

The Metro-Tyler power unit, one of the first of British designs to be totally encased

have been cleaned up, the bristly appearance and dirt-trapping propensities of bolt-on horns, lamps, and speedometers are comparatively trivial. But these components are already being subjected to the necessary treatment, although the process is in its infancy. There is a tendency to eliminate nickel plating. Front fork springs are sometimes encased. Crank cases and gear boxes are cast smooth. Patents are out for cowling in cylinders. The base of the machine is being flattened out into a broad platform with upturned ends in front. Disc wheels are growing in popularity. The magneto is neatly housed on most modern flat twins. Technically speaking, there is absolutely no reason

The Perfectly Fitted Motor Cycle .-

The makers of the Cedos have evidently reasoned on the same lines as our contributor, all the fittings of the machine being rigidly attached to lugs incorporated in the frame.

why the entire power unit should not be encased as completely as it is on a car. Given disc wheels and a neat fork, the machine would then be ten times as "clean" in appearance and in use as any machine which has yet appeared.

Improvements Suggested.

A little thought will reveal how simply many spiky appurtenances of the modern machine can be tidied up. The automatic carburetter already tends to oust the air lever. An ignition lever we must have, but few riders touch it, except on T.T. engines; and it need not be mounted on the handle-bar. The Indian machines have always carried their air lever on the carburetter, because it is seldom operated. A finy knob on the timing cover of the magneto could be operated by the knee on the rare occasions when a slight retard is required. If the pedal clutch is used, only the valve lifter and throttle would remain to be operated from the handle-bar; and, if these controls were of the twist-grip variety, an absolutely clean handle-bar would be the result.

An electric lamp is essentially "cleaner" than an acetylene lamp with generator and tubing. The wiring can be run inside the frame tubes or beneath the detachable side panels covering our imaginary power unit. These panels need not even be of metal; patent leather secured by the Hall lightning fastener would fill the bill. The tail lamp should be sunk flush with the rear number-plate, instead of being: a clipped fitting

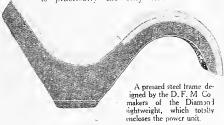

projecting at the side.

The electric hooter should be get-at-able and detachable, since such devices require occasional adjustment. It might be mounted in the angle between the front mudguard and the front forks, or secreted beneath the engine "bonnet." In no case should it be mounted on the handle-bar, where it would look ugly, and disturb the steering balance.

Neat Methods of Fitting Speedometers, etc.

The speedometer might well be accommodated in the tank. Many modern tanks are broad enough at their front ends to house a countersunk clock on one side of the top tube and a speedometer dial on the other. With the "tape" pattern of speed indicator used on some instruments, a very small space of tank surface would be required, since it is not really essential that the distance recorders should be legible from the saddle.

Numbers will cease to be carried on flimsy, protruding sheets of tin. The front numbers might be painted Scott fashion on the sides of the valanced front guard, and the rear numbers will perhaps be painted on the stern panel of a pressed steel rear frame. The saddle is practically the only item which will

refuse to be absorbed into the smooth outlines of the really "clean" machine.

Sooner or later some sound engineer and practical rider will evolve a machine of this character. It will not necessarily be a penny more costly than a bristly machine of the ordinary type, and riders will then inform the industry with no uncertain voice how greatly they dislike the bad appearance and filthy habits of existing types, which only sell because no alternative of equal quality is on offer.

B. H. DAVIES.

THROUGH AMERICAN SPECTACLES.

A LONDON correspondent of our American contemporary Motor Cycling and Bicycling, and one whose nationality is not in doubt, is responsible for the following comments:

"Bicycle motor attachments, which have been thoroughly tested in America and have won merited recognition, are not yet well established in British esteem, although the scooter, which failed to take in America several years ago, is creating quite a furore. From our point of view, it is difficult to understand how some of the British critics can fail to recognise and commend the American bicycle attachments of obvious and proven utility, like the Johnson motor wheel, the Evans power cycle, and the Briggs and Stratton wheel, and then proceed to laud the fantastic British scooter creations. To the American mind, the British scooter seem to be a sort of second cousin to the common or garden variety of lawn mower. It is to laugh when they hear of British propagandists attempting to criticise the American products."

It is hard to believe that the writer of the foregoing is in close touch with the motor cycle movement either in this or his own country. In the first place the "furore" created by the scooter is largely due to prominence given to an American machine by the lay press, which we are now calmly informed failed to take in America. The Johnson motor wheel had not been seen in this country prior to the Olympia Show. The Evans power cycle is of a type which has been marketed in various forms in this country ever since the motor cycle movement commenced.

ever since the motor cycle movement commenced. So far as the Briggs and Stratton wheel is concerned, is this an American invention? Is it not the British Auto-wheel made under licence?

Truly it is to laugh when we hear American opinion, if this be a fair example.

The Editor does not hold himself responsible for the opinions of his correspondents. All letters must be addressed to the Editor, "The Motor Cycle," Heritord Street, Coveniry, and must be accompanied by the writer's name and address.

REMOVING CARBON.

Sir,-A writer in the Scientific American advises using common salt to get rid of the carbon in your cylinders.

"Warm up the engine, remove the plugs, and pour a teaspoonful of salt into each cylinder. Replace the plugs and start the engine, and 'the carbon will pour from the

I wonder how many of your readers have ever tried this method! L. HARLEY.

NIGHT RIDING.

Sir,—May I submit the following suggestion for making night driving less dangerous? I do so, after exhaustive personal tests, with the fullest assurance that it will meet

the exigencies of the case, and prove a boon to all road users.

Instead of the short hood fitted to most lamps, I would make it compulsory to fit a longer and deeper hood that would prevent any rays of light rising above a horizontal line from the burner. A deflecting shutter fitted to the upper half of the lamp's front, diverting all upward rays to a forward direction, would also meet the case. The effect is to strengthen the light on the road, giving clearer vision in fogs and mist, and for approaching lights to disappear gradually from the eyes of drivers when passing each other.

AN IMPROVEMENT IN AIR COOLING.

Sir,—I notice that Captain Lindon Pearson states he has protected a device similar to mine. That may be so, but I fancy that I anticipate him by some time.

I also note that my device, according to Captain Lindon Pearson, will not work except for very light running. It is a small point, but may I state that the engine concerned has been run for many miles under an extra load, i.e., a passenger. It can be overloaded to a degree that can be upheld by official observers, and brought to a stop without any semblance of overheating.

I may also add that the machine is going before the A.C.U. official observers at an early date.

On bench tests the engine has run for half an hour at full throttle, developing 5½ h.p. at 2,000 revolutions. Perhaps this is what Captain Pearson would call "very light through the control of the cont running, HAWLEY MORGAN.

PRICES.

Sir,-Do British motor cycle manufacturers realise how much business they are losing by not taking the trouble to fix the prices of their new models? Many of us are thinking about the coming season, and looking through the advertise-ment pages before placing an order for a new mount. We know we shall not get a new machine in a week, and are prepared to wait, but before committing ourselves we do want to know approximately how much we shall be required to stump up when the long-expected day arrives. Yet we find that firms who have spent thousands of pounds advertising their new models have never yet condescended to give the slightest indication of the prices they propose to charge.
One firm has the pluck to announce that there will be no

increase in its advertised prices for the coming year. May they succeed! If it is possible for one it must be possible for another, and in the coming stress of competition the firm which will face no risks can hope for no prizes. I have been waiting for months to know the price of a certain machine. I will wait a little longer, then, unless the price is published, my order will go where others are going—elsewhere. Cambridge. P.

P.G.S

REPAIR OF ROADS.

Sir,-I would like to back up "D.G.R." in his statement

of roads and road repairing in Scotland.

I am not actually acquainted with the particular road he speaks of, but I can bear out his statements in regard to the

main road from Stirling to Glasgaw.

Near the former town there is a stretch which has been patched time and again, but it is crowded with bumps and pot-holes: in fact, to such an extent that on one occasion I found a steam roller reposing there with a broken rear SOUND LIVER axle.

Stirling, N.B.

DETACHABLE CYLINDER HEADS.

Sir,-I have from time to time seen references in your paper to the difficulty of keeping a gastight joint in the cylinder when fitted with a detachable head. Not long ago "Ixion," in his Comments, refers to this difficulty in connection with a cylinder provided with two annular joints in the combustion chamber, and it has occurred to me that it might not be without interest to mention a dodge which I found very effective years ago on my 1903 Werner. This machine was fitted with a detatchable head held in place by two long bolts passing through lugs in the crank case, and the joint was made with a copper and asbestos washer. For the first three or four hundred miles after decarbonising the compression was always poor, until I hit upon the plan of smearing some engine oil on the copper and asbestos washer before bolting up the head. This oil used to carbonise at once and form a perfectly gastight joint.

Since those days I have ridden machines fitted with cylinders made in one piece, and when decarbonising have often sighed at the thought of the ease with which the job was done in those old days.

A. M. HICKS.

WHY?

Sir,—In reply to the query of your correspondent, "B.T.P.," in your issue of January 1st, as to the reason for what he calls "running down" of the modern three-speeder de luxe, may I venture the opinion that he has missed the point of the

writers ("Ixion," presumably, for one) referred to.

I hardly think anyone doubts for a moment that a very large section of the motor cycling community has no use whatever for volumetric efficiency unless it goes hand in hand whatever for volumetric efficiency unless it goes hand in hand with increased comfort and ease of handling, and the single-geared T.T. models beloved of the sporting section of our pastime very rarely combine their volumetric efficiency with quietness or docility. But to imply, as "B.T.P." does, that the lovers of the single gear belittle in their hearts the modern three-speeder is, in my opinion, misleading. As an ardent enthusiast for the single gear and as the late owner of a very "hot" specimen of this type, I may say that I have no dis-respect for the three-speeder on grounds of inefficiency, although I think the weight of some of the more modern specimens excessive for solo work in normal country. The advantages of a slow quietly running engine and three speeds and clutch are invaluable under certain conditions-in fact, riding without them under these conditions ceases to be a pleasure of any kind.

Nevertheless, there is, and probably always will be, room

for the sporting single speed, because there are, and always will be, motor cyclists who preter tuning one engine ing gears, clutches, chains, etc., in the garage; and driving on throttle, air and spark to driving on clutch and gears on REVS. the road.

Beckenham.

MOTOR (YCLE

BAD TESTING.

Rotherham.

Sir,-May I say a few words in defence of the "D.R.'s." Sir,—May I say a few words in defence of the "D.R.'s." In the Christmas Day number of The Motor Cycle, under the heading of "Bad Testing," "Ixion" says: "I am perfectly certain that my 1919 machines were passed for delivery by D.R. testers, for no C3 man could have started them in the tune in which they reached me," Just over one year ago, the life of a D.R. very often depended on the easy starting of his machine; now is it possible for anyone to forget how to tune a machine in so short a time?

No, the so-called testers of "Ixion's" machines were certainly not D.R's."

certainly not D.R.'s.
Of the four years' despatch riding in France and Belgium. I have not come across a D.R.'s machine that was hard to

"Ixion" asks: "Have all the D.R.'s found excellent jobs?" No; yet another case of those who stayed at home holding the best jobs.

I, for one, was demobilised last April, and have been looking for a tester's or demonstrator's job ever since. Ex-D, R, M, M.

MANUFACTURERS' INSTRUCTIONS.

Sir,-Being one of those ardent motor cyclists who, on seeing any advertisement, book, or pamphlet, even remotely connected with a motor cycle, at once devour it, I am at once struck with the apparently absurd instructions makers

once strikes with the apparatus, issue with their motor cycles.

We are told on taking delivery of a new motor cycle to drive extremely carefully for the first hundred odd miles, and on no account to let the machine "all out"; whilst, and on no account to let the machine "all out"; on the other hand, we have a well-known maker advertising his machines to have exceeded 75 m.p.h.

I also know that the makers of a certain 23 h.p. Japengined lightweight test their machines at 45 m.p.h. : surely an excessive speed for such an engine.

an excessive speed for such an eighte.

Either the makers are making unnecessary trouble in telling their customers not to do this or that, or they will fully mishandle their machines, for the sake of advertisement, before the ultimate owners have a chance to do so.

W. A. BOURNE.

[The makers' advice is good. Not all riders are experts, and the makers have to consider the inexperienced. A short speed burst, with plenty of oil, will not hurt a new engine with every part an accurate fit. It is, however, easy to damage an engine by furious driving and under-Inbrication .- ED.

A REAL PUNCTURE PREVENTER.

Sir,—I was very much surprised to see a description of "A Real Puncture Preventer" in *The Motor Cycle* for December 24th, 1919. I beg to enclose a photograph showing a similar device. This was designed by me in 1911.

An overhead valve Matchless fitted by its owner with a puncture preventer.

you will see it was a piece of sheet iron riveted or bolted to the front of the rear mudguard, and a piece of thick leather with a square of sheet iron riveted to it to keep it flat. If any large substance came in the way it sprang back, and then returned to its former position. I never had a puncture in the back wheel whilst it was fitted.

J. H. WILKINSON.

THE VALUE OF THE AUTOMOBILE ASSOCIATIONS.

Sir,-I observed, a little time back, a reference to a little known department of the Automobile Association, but having had occasion to invoke its aid recently, I am convinced that a wider knowledge of the work of the Association in this direction would be of interest and value to

present and prospective members.

It concerns disputes between members and the trade, and to particularise I may say that 1 purchased, in the summer, a sidecar combination, at a price which was inclusive of various accessories, and was also to include a lamp set for the sidecar. This lamp set was not supplied. and efforts on my part to get the firm in question to fulfil their part of the contract were entirely fruitless; legal process would have been bothersome and expensive. I placed the matter in the hands of the Automobile Associaplaced the matter in the mands of the Automobile Association, and they took it up with such vigour that a most satisfactory offer was made by the firm in question in lieu of supplying the lamp set, which I had eventually purchased

There are many ways in which this method of intervention can be of value to members, and I hope you will agree that it deserves publicity.

London.

THE FUTURE LIGHTWEIGHT MACHINE.

Sir,-Having read with great interest in The Motor Cycle many articles and letters on the above subject, it would be interesting to know how the opinions of your readers agree

with, or differ from, my own on this subject.

I have no knowledge of the manufacturing side of the trade, but have experience of riding all types, and bave had charge of the maintenance and repairs of many makes

of machines.

of machines.

Being stationed in Germany, I lose touch-with current ideas, and can only keep up through the medium of your valued paper, for which I look eagerly every week.

My ideas of the ideals to be aimed at are as follow:

(a.) A machine of light weight, possessing a wider sphere of action than the scooter. (b.) Cheapness of running and low first cost essential; retail price should not exceed £45 complete. (c.) Absolute simplicity, as the majority of riders would be non-technical, and would have little or no time for constant adjustments, etc., being in all probability business men, whose leisure hours are all too short. (d.) Reliability and capability to maintain tune; speed would not be occarrial and 27 w. ph. maximum; control should be occarrial and 27 w. ph. maximum; control should be be essential, say 27 m.p.h. maximum; control should be absolutely simple but safe.

My suggestion for specification is as follows:

Engine: Single-cylinder two-stroke, about 250 c.c.; plain bearings, with lubrication by oscillating pump. Magneto ignition with either fixed or automatically variable firing

Petrol tank to have chamois leather petrol filter fitted in filling orifice, as this entirely prevents entry of water or dirt. Two-speed gear (constant mesh operated by dogs), controlled by handle-bar lever. Shaft and spiral drive to rear wheel. Wheels to be plain pressed steel disc, easily researched the state of the description of the state of the stat movable by large wing nuts, as in new C.L. sidecar com-bination. Easily detachable and contractible rims to be fitted, to minimise puncture repair difficulties. Large tyres.

ntted, to minimise puncture repair dimenties. Large tyres. Frame: Open type of pressed steel to enable it to be a "family 'bus." Spring forks; also a spring saddle pillar, as this would cost and weigh less than a spring frame. Pan seat. Footboards and ample leg-shields and mudguards to avoid the necessity for overalls. Rear stand spring operated.

Brakes: Internal expanding inside crown wheel of rear

wheel, operated by sensible sized pedal and rod.

Nuts and bolts to be, as far as possible, of two or three

sizes at most, to avoid necessity for large and weighty tool kit. Weight should not exceed 110 lb. fully equipped. Mass production and a thoroughly efficient service scheme would be essential. Foolproofness is absolutely necessary. Controls would consist of decompressor, change speed lever,

throttle, and brake.

Correspondents are urged to express themselves as concisely as possible, especially in view of the fact that only a small percentage of letters received can possibly be published. Many interesting letters are unavoidably omitted in consequence of their abnormal length.

Would some practical manufacturer or other experienced person say whether such a machine is possible at the price and weight stated? Opinions on the specification would be highly interesting.

Germany.

D. S. D. WILLIAMS,
Lieut., R.A.S.C., M.T.

FUTURE DESIGN SUGGESTIONS.

Sir,-I believe all serious motor cyclists are keenly alive to the very obvious shortcomings of the present method of construction of the average motor cycle as adopted generally by English manufacturers, and probably in their hearts the majority of makers are just as fully alive to the field that is open to sweeping and real improvement in the machines they are to-day constructing. The chief brake on initiative I put down to the huge demand by the general public, and thus the manufacturer continues to supply a machine that is recognised by himself and the buyer as a mass of assembled oddments, the one exception to this being Mr. Granville Bradshaw's A.B.C., and he has made a real and conscientions effort to produce a machine that had as its origin the drawing board and the brain of an engineer who looked into the future instead of the past. It is perhaps a case of where angels fear to tread, but I want to suggest a few points in addition. Let us do away with tubular construction and have pressed steel frames sprung fore and aft.

Let the hot-stuff engine makers—to choose at random from amongst, say, Blackburne or Metric—produce a clean unit engine with outside flywheel, three speeds, bever

and transverse shaft, and chain sprocket, complete with selfcontained aluminium silencer ready to drop into the pressed steel under tray of the frame with four holts only.

Let the petrol tank be built in front, forming part of really substantial leg guards, pressure fed, and low down. Let the back and front mudguards be at least six inches wide, the front valanced four inches, the back to be valanced level with the aluminium chain cover. The aluminium chain cover to be rigidly fastened on the mside to the frame, the front to be attached by four large wing nuts, the interior to be lined with heavy felt, and two large oil drip lubricators to be fixed over each sprocket.

Internal expanding brakes fore and aft. Back wheel to be able to be withdrawn without disturbing chain, chain case, brake, or chain sprocket. Scrap all Bowden wires, and actuate single-lever carburetter by sector throttle on top frame bar, coupled up to accelerator pedal on footboard; the magneto advance, which requires but little manipulation, to be by hand lever also attached to the top bar of the frame.

Gate change speed, both tyres three and a half inches, and at least two inches clearance between wheels and forks each side; provision for luggage carriers, instantly detachable, on each side of the back wheel. Six inches top width, and extending to the bottom of the chain case, ditto off side; top bar pressing to contain large compartment for tools.

Replace present type saddles by bucket seat with leaf brings. Head light to be built in the frame head, electric

installation and starter, rear lights ditto.

I will engage to say the first English manufacturer who produces a machine on these lines at his own prices will not produces a machine on these times at his one places and need to look for buyers or spend money in advertising. He will have the market that Rolls-Royce or the Hispano people have now.

L.S.D.

Craven Arms.

THE LIGHTING REGULATIONS.

Sir,-I suppose anyone who has the temerity to express, through the medium of the press, views disapproving of any particular cause must expect a more or less uncomplimentary chorus of dissent from its fervent supporters. To this custom I ascribe some of the remarks of your correspondents.

Mr. Holland challenges me to prove his defective logic, but I have neither the time nor the inclination to go into a long dissertation on this head, merely confining myself to a bald statement of facts. Thus: when anyone, referring to another correspondent's letter, gives, in inverted commas, what purports to be an extract from that letter, it is what purports to be an extract nom that letter, it is generally understood that such extract represents a literal rendering of the passage in question. Mr. Holland may, or may not, be aware of this, but the fact remains. "Iorwarth," in his first letter, quotes me as saying (regarding certain impedimenta): "Why should not these have to carry lights as well as bicycles?" I said nothing of the kind, and no one reading my letter in the serious spirit in which it was written would import any such ridiculous meaning into it. The natural, and logical, result was to evoke a protest from me. Mr. Holland then takes up the cudgels on behalf of "Iorwarth," and endeavours to justify what, I repeat, was a deliberate misquotation, and to affect astonishment at my objection. And this is the gentleman

who is so emphatic on his powers of logic and reason! My whole point is this: Anyone who has had much experience of night-riding will admit that the pedal-cyclist is but one item in a long list of obstaces met with. What do the rear-light enthusiasts do when they meet such obstacles if their head lamps do not reveal them? Any experienced rider will also admit that an oil or acetylene rear lamp is not a thing to depend upon to keep alight. If anyone is inclined to dispute this, for goodness sake let him read the account of the experience of some of the acetylene lamp users as recently as the London-Exeter run, to go no further, and thus acquire real knowledge. Read, also, our own motoring papers thoroughly. For instance, "Ixion's" fine article in the issue of January 1st. I am fully in accord with his views, with this reservation, that I object, on principle, to the enforced use of this unreliable lamp. Of all the list I refer to, the lamp enthusiasts pick the court the capit the article way and large the capit. out the cyclist. He must carry a red lamp; he is the only obstruction on the road my head lamp will not reveal; if, as constantly happens, the lamp blows or bumps out, summon him; if he cannot afford the more reliable electric light outfit, let him keep off the road. I, in common with a few thousand others, do not use an electric light set, but I do not intend, on this account, to leave the roads to those who are either too selfish or too silly to ride at a reasonable pace after dark. The grounds they put forward illustrate bace after dark. The grounds they put to make instances the paucity of their arguments, e.g., one gentleman instances the case of ships at sea. Surely, very little reflection is needed to show that the two cases are not analogous. It is also stated that pedestrians and dogs are expected to keep to the side-walk. "Expected," forsooth! Another one calls my letter silly, and it is further contended that the objection to the lamp by cyclists is due to laziness. objection to the lamp by cyclists is due to laziness. Interest the editors of the cycling papers will doubtless appreciate the implied compliment if the energy they display in combating this iniquity is any criterion. Or are they anxious, for some occult reason, to assist in compassing the death of their very numerous clienticle. Why was not the lamp considered necessary before the war? Also, how many of these rabid enthusiasts of rear lamps (for others) [and themselves. E.D.] have had bona-fide accidents with cyclists before 1915? The unanimity with which some of your correspondents tilt at the cyclist, and refrain from any suggestion as to how the many other obstructions one is liable to "crash" over when riding too fast at night, are to be dealt with is, to say the least of it, significant.

[As the riders of pedal cycles are alone among users of road reasonable regulation, it is only natural that the comments of those who approve of the said regulation should there is the directed to them, and we fail to see that "Sivel" has proved that the pedal cycle only should be exempt from a rule which tends to the general safety. Both sides have had an opportunity of expressing their views, and the correspondence, which is wandering from the point, must now cease .- ED. 1

"THE MOTOR CYCLE" ROAD MAPS.
England and Wales, Scotland, London (showing roads into and out of London and avoiding London).
Mounted on linen. Set of three, complete in case

Obtainable by post (remittance with order) from LIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.;, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and no none side of the paper only, numbering each query separately, and keeping a copy for case of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Slipping Shock Absorber,

I have a 4 h.p. single-cylinder all-chain machine fitted with a Jardine two-speed gear box. The friction plate cush drive is always giving trouble, viz., slipping sprocket on the engine-shaft. I shall be much obliged if you will tell me how to remedy this.—V.P.B.

Clean out the plates of the shock absorber with paraffin, and screw up the adjust-ment rather tightly.

Small Two-strokes.

Would you give me some opinion of small two-strokes as regards wear and general reliability, also what mileage per gallon has been obtained with them? I have had varieties. I have had varying opinions given me as regards petrol consumption, from 60 to 140 m.p.g.—F.D.

Small two-stroke machines have an ex-Small two-stoke machines have an ex-cellent reputation for wearing qualities and general reliability. The average consumption with single-geared models of the best makes is in the neighbour-hood of 100 m.p.g. We have heard of much better consumption, however, than this: 120 m.p.g. is not uncommon.

Making a Dynamo.

Might I have your advice on the following? I have a three magnet type ringing magneto, out of a telephone instrument, which I have converted into an A.C. generator by means of a slip ring. I am desirous of winding the armature to get about 4 volts (I or 2 amps.), to get about 4 volts (I or 2 amps.), to act as a lighting dyname on a motor cycle—alternating current, of course. Could you tell me what gauge wire would give the best results, and the approximate quantity thereof? This output to be given at a reasonable r.p.m., to permit of gearing for an average road speed. I am presuming that the permanent meaners will not that the permanent magnets will not allow the output to rise above 5 volts when at high speeds. Will a choking coil be necessary automatically to regulate as far as possible its fluctuations in voltage ?—I.R.F.

We presume you intend to use a single coil winding on an ordinary H-shaped We presume you intend to use a single coil winding on an ordinary H-shaped core like a magneto armature. In this case use No. 26 S.W.G., enamelled if you can get it, or double silk covered otherwise. Wind on as much of this as you can get into the slots. The more you can get in the slower will be the necessary speed. The voltage given will depend on the strength of your telephone. depend on the strength of your telephone magnets. You are, no doubt, aware of

the necessity of keeping an iron guard across the pole pieces all the time that across the pole pieces all the time that the armature core is not in place between the poles. This is most important in order to retain the strength of the magnets. Also make the air gap between the pole pieces and the armature core as small as possible. We think you should obtain the result you desire at except the pole. a reasonable speed. A choking coil will not be required; the constant strength of the permanent magnets and the armature reaction will keep down the output at high speeds.

Seized Piston.

I have just recently purchased an O.K. Junior motor cycle fitted with a Villiers two-stroke engine. After running about thirty miles the piston stuck, and I was un-able to turn the flywheel. The cylinder was removed, and although the crank case was half full of oil, there was not a drop on the piston or on the little end bearing. There is no dirt on the gudgeon pin, and the oil hole is pointing towards the bottom of the engine. -C.E.H.

From your description we should imagine that the piston seized momentarily in the cylinder. This might be caused by its being originally too tight. After a few miles light running, never exceeding half throttle on the level, there should be no danger of this recurring.

THE NEXT STAGE!

MOTOR CYCLISTS interested in small or large cars should read

The forerunner of all motoring journals. Founded in 1895, it remains the largest and most successful automobile paper, and enjoys the greatest circulation. It is universally accepted as the representative British motoring journal.

Ď

Chain v. Chain-cum-belt.

I have recently placed an order for a motor cycle with chain-cumbelt transmission, for which I thought of getting a sidecar; but one thing that has struck me very much since I placed the order has been the great difference of opinion as to the relative value of the all-chain or the chain-cum-belt drive amongst my friends. As I have had no experience of the all-chain drive, I should like your opinion .- J.H.

Our own preference would be for the model having chain drive throughout. At the same time there is no objection to At the same time there is no objection to the chain-cum-belt models, especially for solo use or ordinary sidecar touring. With a heavy sidecar in very hilly country, in wet weather, you might experience a certain amount of belt slip, but, in other respects, the chain-cum-belt transmission is thoroughly reliable.

Effect of Windscreen.

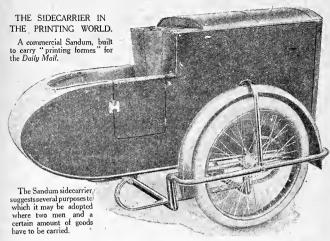

How does the extra wind resistance of a sidecar wind-screen, fitted to a 3½ h.p. outfit, affect the running?—A.M.W.

In actual experience we do not find that a rounded windscreen creates any appreciable increase in wind resistance. and increase in wind resistance. We recently made tests with and without such a screen in operation on a 4 h.p. single cylinder machine with a view to ascertaining if the petrol consumption was increased by its use; we found that there was no difference at all. The type of sidecar and screen, however, may make a big difference.

Double-pole Ignition.

Can I obtain a magneto which will give two sparks simultane-ously, and, if so, where? If I cannot obtain a magneto as above, can I fire two plugs at once from a single magneto by connecting in parallel, or by storing every alternate spark in a condenser and running the magneto at twice the engine speed ?-P.B.T.

Before the war a two-spark magneto was made by the Bosch Co., but we do not think any of the English manufacturers have yet placed one on the market. The makers of the Lodge sparking plng manufacture a double pole plug which can be connected to an ordinary plug in order obtain two simultaneous sparks. Possibly this might be of use to you. You cannot fire two plugs simultaneously (if they are connected in parallel) from an ordinary magneto.

Payment of Tax.

I have just purchased a motor cycle, and wish to know if it will be necessary to pay tax at once, or do I get twenty-eight days' grace?—C.K.S.

You are not bound to take out the In-You are not bound to take out the In-land Revenue licence immediately, and twenty-eight days' grace is usually allowed; at the same time use of the machine renders you liable to pay the tax, even though you dispose of the machine before the twenty-eight days expire. It is much safer to pay at once.

Revs. and Speed.

My 31 h.p. Rudge Multi will o 33 m.p.h. on low gear (7 to 1), climbing Handcross Hill, Sussex, on the road to Brighton. This works out at roughly 3,010 revs. per minute. Calulating on these revs., my machine when in a gear of 41 to 1 (the gear I have found most satisfactory for speed) should do over 51 m.p.h. Instead of this it will only do 46 m.p.h. on the level. Can you give me the reason? The only solution I have been reason? The only solution I have been able to find is belt-slip, but in any case why should the belt slip beyond 46 on a fairly high gear, when it does not slip at 33 m.p.h. on a hill on low gear?—E.M.

The point you raise is very interesting, although it is not open to any obvious solution. It is, of course, well known that certain engines will "rev" more freely on light load, and racing experience has often proved, by slightly lowering the gear, higher speeds may be obtained. Perhaps you have not taken into consideration the effect of wind resistance at high speeds; this resistance increases as the square of the speed, and the power should increase as the cube of the speed. At the same time, this does not fully explain your inability to exceed 46 m.p.h. on the 4½ to 1 gear, and we should think that at high speeds on this gear, when you will necessarily be using full throttle, the engine is starved, and would suggest the fitting of a slightly larger jet.

Extra Air for Triumph.

I have a 1919 4 h.p. Triumph, and wish to ask you if there is any appliance on the market for fixing to the carburetter as an extra or enlarged air intake. Riding all last summer I was under the impression that the engine would have taken more air; but having the air control fully open I could not give the engine more.—W.S.

We know of no fitments on the market which provide an extra air supply specially for the Triumph carburetter. This carbu-retter works almost automatically, and it is usual to run it with the air fully open. If the petrol consumption is abnormal, you might try fitting a smaller jet. The you might bry netting a smaller jet. The usual consumption with this machine is about 90-100 m.p.g. solo, and 70-80 with sidecar. If a reduction of jet size does not meet your requirements, we would suggest that you have a small compression tap inserted in the inlet pipe between the carburetter and the engine, or a proprietary air inlet, such as the Bowden.

Excessive Consumption on Two-stroke.

I have bought a 23 h.p. twostroke motor cycle, but cannot make out why it should use so much petrol. Its consumption is about 36 miles to the gallon, and I have taken the jet out, which proves to be size 24. Will you tell me if it is the fault of the jet or any other fault of the engine? It is no trouble to start, and runs well.—B.A.

The petrol consumption of your engine is certainly excessive, and we should imagine that it is due to flooding of the Imagine that it is due to nooting or one carburetter. You do not state the make of the latter, but if it is an Amac, the level should be set quite low—about \(\frac{1}{16}\) in, play being allowed between the needle split pin and the float. With any other set the level about other carburetter, set the level about \$\frac{3}{2}\$in. below the top of the jet. Overhaul the fuel supply system to ensure that there are no leaks. The jet size appears to be correct, but may have been enlarged. It is advisable to run with

the ignition fully advanced, and you should verify the timing as follows: With the ignition control in the advanced position, the contact braker points should separate when the piston is 5 in. from the top of the stroke.

Blow-back on Two-stroke.

The two-stroke engine fitted to my motor cycle has developed the annoying trouble of blowing back through the carburetter (Senspray fitted). I have thoroughly overhauled the engine, cleaned the carburetter, petrol pipe, jet; in fact, every part that would be likely to cause this. I have tried raising petrol level, changing jets, and flooding, etc., which do not improve matters very much. This trouble is caused in two ways, I am given to understand, viz.: shortage of petrol and under lubrication.—J.E.B.

Since you have effected various carburetter adjustments without eliminating the trouble, we are led to believe that the cause of your engine's irregular running lies in some defect of the ignition system. Probably a new sparking back through the carburetter

tion system. Probably a new sparking plug, especially one that does not project too far into the cylinder, will put matters right; also, see that the piston rings are

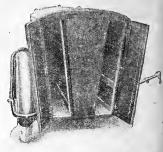

READER'S REPLY.

In reply to "D.J.'s" (Chelsea) query under "Experiences Wanted" in your issue of January 8th, I would not recom-mend steel-studded tyres where tramlines are encountered, my own experience being (especially on a greasy day) there is more tendency to skid with these fitted.— SUNBEAM (Twickenham).

MISCELLANEOUS ADVERTISEMENTS.

ADVERTISEMENTS in these columns First 12 words 2/6, and 2d. for every additional word. Paragraphs of under 8 words are charged double rate, i.e., 5/-. paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19. Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue

in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle." Office. When this is desired, the sum of 6t, to defray the cost of registration and to cover postage on replies must be added to the Backers of 6t. The Motor Cycle." Only theorems become Backers of 6t. The Motor Cycle." Only theorems and the sum of 6t. to defray the cost of registration and to cover postage on replies must be added to the Backers of 6t. The Motor Cycle." Only theorems of the sum of

DEPOSIT SYSTEM.

Persons who hesita to to send money to unknown persons may deal with the more than the send of the person of the p

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to rezard the stience as an outdication that the goods advertised was ready been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

The International Congress.

SIGN that we have finished with the war. and that more or less peaceful conditions now prevail, is that representatives of the world's motor cycle organisations met last week in London. The conference of delegates of the Fédération Internationale des Clubs Motocyclistes was notable for the undoubted good spirit which animated the whole proceedings. The Motor Cycle was closely in touch with the visiting delegates, and the result of our conversations with them appears in another part of this issue.

An outstanding impression of the gathering in London was the evidence of a great potential demand for motor cycles in every country represented-and also in the Antipodes. It was affirmed that in New Zealand there are more motor cyclists in proportion to population than any other part of the world-not excluding, the United States of America—while the potential demand is enormous. In France, Belgium, Holland, Switzerland, and America, demand and outputs continue to grow, placing the world's motor cycle industries in an important position in the commerce of the nations.

The position of Germany and Austria as members of the F.I.C.M. is now defined. Our late enemies are to be permitted to join when they are admitted to the League of Nations.

An interesting point was raised in connection with America, in which country the body governing competitions is a Trade organisation. It has been a general idea in this country that trade control of the sport and the development of the motor cycle is highly undesirable, and, no doubt, there are many arguments to support this contention; but in the United States conditions prevail of which the average British motor cyclist is not cognisant. It may be said that the motor cycle movement across the Atlantic has been built up more by trade propaganda than by riders themselves. The system has been highly successful, and since the

"trade" took over the duties, for which, in this country, the A.C.U. is responsible, there have been better organised competitions than at any time during the life of the Federation of American Motor Cyclists, which has now ceased to exist. The Motor Cycle and Allied Trades Association of America, therefore, is accepted, subject to endorsement by the Automobile Club of America, as a suitable body to represent United States motor cyclists at the F.I.C.M.

Home-produced Fuels.

F ever argument was wanted to emphasise the desirability of encouraging in every possible way the production of homeproduced fuel, either power alcohol or benzole, the constant threats of increased petrol prices, once more before the motoring public, provide it. For some time carefully prepared propaganda has been appearing in the daily press preparing consumers of imported fuels for impending rises in prices for which the increased cost of freightage is largely blamed. So long as imported petrol is the fuel used by the majority, the chances of an unexpected rise in price will always threaten motor cyclists and motorists of this country. journal has ofttimes pointed out the absurdity of an important key industry, such as the automobile industry of this country represents, being nominally "controlled" by the petrol ring. The British Government has constantly been urged to take action to develop a home-produced fuel and to centrol our own oilfields abroad.

Unfortunately, there is no direct competitor to the petrol trusts. The distributing of benzole leaves much to be desired, and, in spite of the propaganda to convince fuel retailers that benzole has no detrimental effects upon engines, to counter the efforts of the petrol trusts to prove otherwise. No one who uses N.B.A. fuel has any doubt as to its all-round efficiency, while the recent A.A. ro,000 miles test proved that no deleterious effects accrue.

Helmets-for Wet Weather.

KINDLY correspondent, noting my wails about suitable headgear for motor cycling in wet weather, informs me that he uses helmets. He carries two spares in wet weather, and hangs them on the plate rack over the kitchen range on reaching home. Next morning they have quite recovered. This gentleman is evidently a bit of a wholesaler. I should hate to ruffle his feelings, but if by helmets he means those pseudo-airman, hun-crash, leather skullcap brain-warmers, I have no use for them. If the sun is shining, you get dazzle-blindness. If it hails, your eyes get mashed to a plup. If it rains, there is a river down your back. Dismounted, you feel-and look-an idiot, unless you carry a Saxeblue velours flapper-dazzler crushed up in your side pocket, and at the present price of velours I cannot afford to do-that. When the war was on, things were different. You could walk down Bond Street in one of those helmets, and some dear old patriot probably. mistook you for Warneford or McCudden, and invited you to refresh at his expense. Nowadays one just feels silly in them. Next, please. .

A Goak.

OME famous literary man—I forget whether it was Uncle Remus or the chap who wrote the was Uncle Remus or the chap who wrote the office boy's column in Ally Sloper—used to append the phrase "N.B,-This is a goak" to any remarks of a humorous nature. This legend ought certainly to have been inscribed on a label attached to a new machine of leading make recently delivered to one of our readers. He took delivery, and, after repeated failures to start the engine, he began to dismantle sundry items. Finally, he discovered that the carburetter jet was so far from having been flowmetered that it had not even been drilled. The point of the drill had been entered in the jet plug, but had been stopped before it broke through, so that there was no spraying orifice at all. As if this were not enough, the oil feed pipe to the crank case was neatly blocked with a blob of solder. This is sabotage of the first order. I should advise my correspondent to investigate. He will probably find out that he cut out the head tester with a pretty flapper. Revenge is sweet.

Against Naked Chains.

HAVE always been puzzled by the discrepant testimonies produced by apparently honest men as to the working life of a chain. The last year or two has given me a glimmering of the key to such contradictions. For one thing, some chain drives are poorly insulated from shock, whilst others run like oiled silk. For another, some chains are encased, and others are naked. I have just stabled a machine of the latter variety after a century run in heavy rain over sloshy roads. The chain is literally dripping with rain-diluted mud. Water is certainly present in all

its joints and on all its bearing surfaces. The only thing an engineer can possibly do is to defer the hot drink, hot bath, and hot dinner, of which I have been dreaming for the past four hours, detach that chain, and put it in a paraffin bath. Not being an engineer, but a plain John Citizen sort of fellow, with a slack mouth such as Poy loves, I shan't do it. To-morrow that chain will be red rusty in the portions which are not gunbarrel-finished, i.e., the invisible working surfaces. If I bathe it in paraffin all to-morrow, and then relubricate it, it will be a little the worse-not much, but a little. If I need the machine to-morrow, it will get no paraffin bath: it will go out with little orange flakes corroding every vital atom of it, and be in a worse mess to-morrow night. On the other hand, if I don't feel like a ride to-morrow (it is hailing as I write), I shall probably feel still less like befouling myself in the garage-being a plain John Citizen, as stated above, and self-indulgent when I know the Editor is away at Birmingham. In that case, the rust-coat will probably be paraffin-proof by to-morrow night; and if it isn't, the Editor will be back the next morning, I shall have to put up a show of work, and there won't be time for that paraffin bath. It is easy to estimate how long my naked chain will last under this treatment. On the other hand, I am daily expecting a machine with enclosed chains; and, if it had been my steed this day, you could strip and inspect its chains after the century runs, and find them lusciously oozing nice, green engine oil from every interstice. Vcrb. sap. All the same, just to be inconsistent, I'd sooner have chains naked than encased according to sundry fashions, which have afflicted me in the past. And that's just where the shoe sometimes pinches, isn't it?

The Chances of the Monocar.

Y paragraph on the monocar has tickled up several enthusiasts, one or two of whom are busily experimenting with a view to commercial production. The most obvious snag is indicated by the fact that 98% of the enquiries received by one firm specified the addition of an extra seat for occasional use! Such experiences dishearten designers, and switch them off into something which affords good flapper transport. On the other hand, it must ever be remembered that there are now at least 200,000 wouldbe motor cyclists in this country; and when we have written off the man who adds a sidecar or a carrier cushion, the surplus must include innumerable potential monocarists. The potential monocarist, to my mind, is the man who generally travels alone, whether by compulsion or for preference; who dislikes sideslip; who dislikes cold; who dislikes dirt; and who dislikes the weird garb essential to all-weather cycling.

Gentlemen, if a leading firm, e.g., the Triumph, marketed a monocar at a low price—a machine which could not and would not carry two people anyhow, which gave no more trouble than a motor bicycle, and

Occasional Comments.-

which cost comparatively little to buy and run—do we not all know that most of the roughriders would buy it? There are thus three requisites for the starting of a booin in monocars, viz.:

(1.) Quality. It must be good, and known as such.(2.) Self-restraint. Any form of dickey must be

anathema maranatha.

(3.) Price. At £200 it would hardly attract. It must be nearer the price of a solo mount.

My Dreadnought Kit.

DO not believe it is possible to devise a coldproof kit even for our comparatively mild British winter, but I have at last evolved a waterproof kit which is at least tolerably frostproof. In summer I wear Barbour oilies as drencherproofs: they fulfil their primary purpose admirably, and have the additional merits of being cheap, portable, and as presentable as any other motor cycling rig can be—which is not saying so very much after all. For winter I don, item, a leather helmet (Astrakhan or Bolshevist pattern) by Shekman

of Tyne Dock, with side and back flaps; item, a heavy twill suit by Irvine Smith of Bradford, which has not let a drop n anywhere yet put lots of leather inderneath, of ourse); item, either of two pairs of gauntets, one a special pair built by Dunof proofed will, lined leece, the other a nitt designed for he Archangel Force, with three kins-twill, para ubber, and camel leece; item, a pair of gum boots. The annular orifice" at he neck is the sole ulnerable point in uch a get-up, andhat is best guarded y having the collar the jacket careully tailored t close roundorresco referenscelluloid collar, he coat collar and he celluloid atrocity eing carefully apered to fit toether like the male nd female portions f a cone clutch. here are jugginses

broad who swear

by the sort of scarf which rowing men used to call a cravat. It certainly caulks the above-mentioned orifice successfully, but it is unco' clammy after an hour's rain; and my own dodge is far, far better. But of my hoary experience, I present the inwary with an invaluable tip anent celluloid collars. In my youth I regarded such collars as a social crime, on a par with shovelling peas into one's mouth with a knife. When I tardily discovered their celestial affinities with motor cycling, the sporting hosier who put me on to them gave me warnings. I must use a hinged stud, bien entendu. As an ordinary tie would seize in celluloid bearings, I must use a made-up stock, affixed by a spring pin in the back half of a special stud. His made-up ties were truly frightful. I finally selected a chaste pattern in Saxe blue with multigatawny dragons on it. Thus attired, I started out on a Six Days. At 7 p.m. we arrived at the Empire at Bath, or some such caravanserai. discovered my made up tie had projected itself automatically into the void. All the shops were shut. I · bribed a waiter, and dined in a pink sailor knot with

a semi-gladstone collar two sizes too large. Moral: if you motor cycle in a celluloid collar (and sooner or later you must), always carry a spare

tie.

Wrenched Sidecar Frames.

Y own enthusiasm for sidecars has always been somewhat tepid, and the present paragraph is inspired by several correspondents who have asked me to take the matter up. They find that with various makes of combination the rear cover does not give a satisfactory working life, and, on examination, they notice that the rear half of the bicycle frame has been badly wrenched over towards the sidecar. They allege that the rear connections of the sidecar to the cycle frame are responsible. I merely ventilate a grievance which reaches me with some insistence.

Now that one is free to tour in France and Italy, possibly the beautiful districts of those countries will attract many motor cyclists who viewed the exquisite scenery under war conditions. The photograph shows despatch riders in Northern Italy in less happy days.

WEIGHT, COMFORT, AND

VERY motor cyclist has his fads. Some men plump for a substantial simplicity, some for a sports model, others for a flat twin, and so forth. Personally, now that we can take cooling and climbing and reliability-the naked essentials of a usable machine-for granted, I attach increasing importance

to weight, comfort, and cleanliness. So far as weight is concerned, 1920 model's bring two plain tendencies into relief. The first is that general purpose touring machines are designed and constructed practically regardless of weight. It is hardly an exaggeration to say that nobody cares and nobody knows what is the ready-for-the-road weight of any machine exceeding 500 c.c. It is unquestionable that the popularity of the sidecar is answerable for Post-war machines which scaled this recklessness. less than 2 cwt. a year ago in their experimental form now tot up to nearly 3 cwt. The public does not complain. It buys these monsters with avidity. On the other hand, there is an equally clear demand for light machines, but no discriminating rider sets them on a level with the bigger machines in general quality; and dozens of them are still very dark horses indeed. Now, my main point is that these opposed tendencies are bound to react on each other. The machines which are easy to handle, cheap to buy and cheap to run, are not general purpose machines. They are being sold to people who dislike handling several hundredweight of metal, who do not care to expend. over £100 on a solo mount, and who wish to economise in petrol, tyres, etc. These buyers will, in most cases, yearn for a general purpose machine which is very light and very economical. Sooner or later a designer will produce a specification along these lines; and then the heavyweight firms will get busy on new lines. That day is not yet. There is an That day is not yet. immense advance in the number of lightweights of all patterns. Some of them are "designed" jobs from stem to stern, with nothing experimental, shoddy, or criticisable about them. The all-purpose mediumweight is almost conspicuous by its absence-even the dear little 234 h.p. Douglas has put on a lot of flesh since its original debut as a multi-speeder, and it has hardly a single competitor in its class. The big fellows are becoming extraordinarily heavy, what with their dynamos, spring frames, detachable wheels, and other bulky additions.

Comfort.

When we turn to the question of comfort, we note much riper progress. Designers admit that the layout of a perfect spring frame is an extraordinarily tough proposition. In spite of this, there are many new spring frames. Simultaneously a strong critical school has arisen. Some makers say in effect, "Extra insulation from road shocks is unquestionably needed; but the spring frame is the wrong means to a noble end." So a good many engineers propound special methods of mounting the saddle in lieu of springing the entire rear frame. The merits of this revived antiquity are obvious. It is neater, lighter, and cheaper than any spring frame can ever be. On the other hand, it has equally plain shortcomings. It furnishes no protection whatever for the chassis. It cannot endue the rider with as much comfort as a spring frame unless his footrests are also sprung (e.g., Bat fashion). In other words, it is a compromise. Next season will show whether riders will accept the compromise as a sound substitute for a fully sprung frame. I think it is quite possible, especially if spring footrests accompany it. In this connection we must rejoice that no previous year has produced such a luxuriant crop of new spring forks. The experts always said that the introduction of good rear springs would compel many front forks to be redesigned. They were right. The man who fits a good sprung rear frame immediately notices what a lot of jolts he gets from his front wheel. On the whole, however, the industry is in a remarkably healthy condition on the score of comfort. It has improved spring forks, added rear springing in one form or another, and standardised larger tyres. These are wise efforts to cope with the appalling badness of our roads, and the fact that many recruits to the sport are less hardy than the youthful sportsmen who once provided the majority of riders.

Cleanliness.

Scientific efforts-to produce a machine which will keep itself and its rider clean, or which will be easily cleansed of such dirt as it collects, are very few and far between. On the other hand, the "clean". machines are nearly all of the best grade in other respects, and will exercise an influence on development quite out of all proportion to their numbers. The commonest specification is somewhat as follows: The front mudguard is a little wider than it used to be, and has deep side flanges. You can say two things of it-that it will divert all filth flung from the top arc of the wheel (say from ten to five o'clock on the circumference, viewing the wheel from the near side), and that the wheel will never be jammed in the guard by accumulated dirt. But the designer has not thought what will become of the mud flung off the wheel. He has taken no steps to deliver it at the rear tail of the guard, or even to prevent liquid mud from being blown backwards off the entire arcs of the edges of the flanges. So in imagination we follow this flung mud

Weight, Comfort, and Cleanliness .-

backwards towards the chassis of the machine, and we find that it will foul the silencer (perhaps necessarily); besmirch the magneto in some cases, and on not a few flat twins the front cylinder head and especially the front sparking plug; soil the rider's legs and feet, and bespatter a host of awkwardly-shaped projections and inaccessible crannies in front of the engine, beneath the engine, and on both sides of the engine. There may be a small flap to guard the magneto; but nothing else is generally protected except the rider's boot soles, which 'lie flat on aluminium plates, and are already dirty.

Some Good Examples.

Contrast this thoughtless layout with that of the Douglas or A.B.C. or Cedos or Scott. These machines embody front, side, and underneath protection in various forms. The filth—solid or liquid—flung back from the front wheel is caught and diverted just about as efficiently as riding conditions permit. You must allow a good draught to impinge on the silencer and on the cylinder-cooling devices. In each of the above cases the front screening is as complete is is compatible with efficiency. In each case the cootboards either form part of a wide underscreen or me mounted upon such a screen. This screen extends ight underneath the machine from side to side, so that

an absolutely smooth surface is presented, and cleaning is proportionately facilitated. In the Cedos, in particular, the underscreen is carried right aft and joined up to the rear mudguard. No designer has gone the whole hog, in the sense of enclosing his power unit in a smooth, slab-sided casing, though I understand the Black Prince design allows for this. But these four machines present schemes for keeping all front wheel flingings off the rider and off the mechanism. None of them is appreciably heavier or costlier than the common or garden layout, which either deserves such a stigma as the word "naked" implies, or else hesitates and is lost. Many machines are fitted with contemptible little front shields, large footplates, and possibly a petty caricature of an underscreen. If these four items had been joined up into one big all-embracing protector, they would be rideable in cricket toggery, and would neither have cost nor weighed much more than at present.

Rustproof Finish.

A parallel tendency is apparent on different lines. A few machines—notably the Beardmore-Precision and the Cedos—evince far less nickel plating than we are accustomed to. Some years ago the Rudge took a bold stride in abolishing nickel-plated handle-bars. The two machines named go a step further in the same direction.

An Electric Sidecar Outlit.

Silençe, Even Torque, and Simple Control are its Chief Advantages.

T is perhaps true that the electric motor cycle is the ideal of the majority of motor cyclists. Whenever they are asked to prophesy the

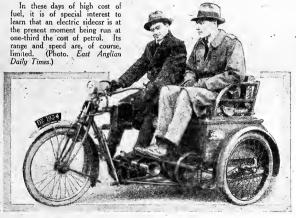

ype of machine f the future, they lmost invariably "Electric," lthough they may now little about lectricity. They ealise that, so rapid ave been developients in its connecon, sooner or later ew discoveries may iake possible the ight, powerful, lectrical vehicle a ractical propo-

The machine ilistrated was made the Orwell Works, pswich, where elecric commercial tacks are built, to the order and design f Mr. P. A. G.

Iossay for service when petrol was scarce. As will e seen, the nucleus of a petrol-driven machine was sed as the basis, and the electrical equipment was of designed specially for the machine; which might considerably modified and lightened for this purpose.

We are informed that, even in its present form, the machine has a thirty miles range at one charging, which from town mains at twopence per unit costs

sixpence (one-fifth of a penny per mile, as compared with three - fifths of a penny the average petrol machine costs for the same distance). With its present equipment, the machine is capable of about 12 m.p.h., but, we understand, it will climb any hill in the district. Its great advantage is, of course, its cleanliness and simplicity of control, there being one switch only, which operates very much after the manner of those on electric tramcars. The accumulators

are carried in the box sidecar. Obviously a good deal of space is occupied by the batteries, and the electric system could not readily be applied to a solo motor cycle; suitably designed, however, the sidecar accommodation need not be too much limited.

The BIG SINGLE as a

MOUNT

Experiences with and Impressions of a Norton "Big Four."

RYPERIENCE with the Norton "Big Four" has shattered all the writer's preconceived ideas of big single-cylinder engines. The first run with this 637 c.c. mount attached to a heavy sidecar was something of a revelation, especially to one who had always associated really fast sidecar touring with the 8 h.p. twin to the exclusion of smaller capacity engines.

A knowledge of the exploits of the Norton "Brooklands" model and, indeed, of the ordinary "Roadster" models, led one at the outset to expect something a little out of the general run of single-cylinder engines. There

was, however, at the back of the mind, a feeling that a big chain-driven single would lack the refinement of running, if it can be so expressed, that one obtains

with a multi-cylinder engine.

The first striking feature, however, on taking out the machine was the remarkable smoothness of the transmission and the manner in which the engine "turned over." It would be absurd to say that it was vibrationless, but it can truthfully be said that there was a good deal less vibration than is produced by many twins. One sometimes says in laudation of a rider that he was "part of the machine." In truth, one does feel part of the machine on some mounts, and many will recollect certain motor cycles which seemed to convey every movement, every bit of vibration of very working part—even to the studs on the tyre, via the hands through the body to one's very extremities.

Sitting on the saddle of the "Big Four." one feels very little of the engine; its "kick" is devoted to its proper function, and not to making the rider un-

comfortable.

In these brief notes, a mention, too, might be made of the sidecar that was attached. This was a double-sprung Grindlay. It will be remembered that the wheel of the sidecar is carried between two long semi-elliptic springs. For very particular reasons, the writer was most anxious to obtain a sidecar which insulated the passenger from all road shocks, and also was roomy enough to take a child, and the choice was completely justified.

A long run from Coventry to mid-Lincolnshire was the first serious test of the combination, when

two adults and a child and a quantity of heavy luggage constituted the load. On this occasion, the newness of the engine dictated the policy of moderate speeds, and the long straight stretches of the Fosseway between Leicester and Lincoln were covered at It was on this a "trot." road at a later date, when the engine was well "run in," that a test was undertaken which few private sidecars ever undergo. In the interval, the Norton's capacity and positive liking for hill-climbing was fully realised. On one occasion a fast run was undertaken from Birmingham to the Worcestershire Beacon.

With a passenger in the sidecar and with a warm engine, the hill through Malvern to the cutting at the top of the Wyche, leading to the actual track up the Beacon, was climbed on top gear. The Beacon itself is, of course, an ordinary climb, and the summit was easily surmounted.

Good results on freak hills are no criterion as to an engine's "suitability" for touring. The most important thing is to know whether the engine will tire after a long run at speed on the road, and whetherit can stand stiff climbs against the wind on a road deep in mud with the hood up and carrying a bigload after it has covered sixty miles non-stop.

This the Norton has done, and the following test—really a more severe one than it appears—proved conclusively that it can do, as much as the 'great majority of 8 h.p. machines. When riding along that fine speedway between Six Hills and Lincoln—forty miles—probably the longest straight stretch of engineered roadway in England—the writer wondered what would happen if he rode that distance "all out" with just one slowing up in Newark. Would it be valve, chains, plugs, or tyres that would give up the ghost, or would the engine simply "peter" out through oferheating?

"They Rode Straight, those Old Centurians."

It eventually happened that Six Hills was reached one fine autumn morning with a heavily loaded sidecar, and there and then a decision was reached to make a "record" run.

With windscreen up, the throttle was opened and plenty of oil supplied. The ribbon of roadway lay

The "Big Single" as a Sidecar Machine .-

straight as a spear in front. The old Romans scorned hills and dales—they cut straight across them—there was no deviating to avoid a rise. The actual speed need not be mentioned; the engine roared on full throttle as fast as it could be driven for mile after mile. There are no villages, and only one or two minor cross-roads quite visible. It was no temporary speed burst, but a gruelling such as probably could take place nowhere else in this country, except at Brooklands.

At first there was an uncomfortable feeling that

it was not fair to the engine; one thought of broken chains, then of the valves. After five or six miles of "blinding," commonsense dictated a more moderate speed, but it was to be a test, and so onward. Down one. or two small declines the road speed was slightly slackened, but not sufficiently to cool the engine in the slightest legree.

At Newark there was, of course, an down—the aarrow "gates" of the old town necessitated this. First hrough Millgate,

hen Castlegate, Bargate, and finally Northgate, and in to the straight flat stretch of Lincoln Fossway. On this run of sixteen miles, there are no villages intil four miles from Lincoln and full throttle was given again immediately on leaving the town. It was on this stretch that a modern 8 h.p. sidecar was observed ahead and finally passed after a tussle—and a sporting contest it was too. The run culminated in the climb of Lincoln cliff past the cathedral; his acclivity needing only second gear at the bad bend before the archway.

The "Big Four" Norton on the road. An outstanding feature of this machine is its ability to maintain high speeds with heavy loads without overheating.

It was a great run, and on dismounting the writer metaphorically patted the machine. It had stood practically full throttle—old motor cyclists will know what that means—for forty miles without the slightest feeling of distress, and was as lively at the end of the run as it was at the beginning. It should be remembered, too, that a heavily loaded coachbuilt sidecar was futed, and that this was equipped with a screen, side curtain, and a grid carrying a quantity of luggage, enough to dry up the best of engines when driven all out for many miles.

After such a test, one was constrained to ask, "Why run a twin?" Well, Why?

The single cylinder has the advantage of the simplicity which, even in these days of "no trouble" twins, is something of a comfort. To the gallon of petrol, sixty-six miles can be covered, and the oil consumption is also low. Valve trouble is practically unknown on Nortons, and the engine is quite happy with carbon deposit of many hundreds of miles running still within the cylinder.

With the exception of a minor repair to the chain case and rear brake adjustment, nothing whatever has been done to the machine since taking delivery. "A good wine needs no bush," it is said, yet a good thing should be known, and, from the writer's experience, the Norton "Big Four" is everything the makers claim for it. A final word also is needed for the sidecar—Mr. Grindlay's patent suspension has proved particularly efficient; one can pass over the most atrocious pot-holes at a speed impossible with a rigid wheel sidecar.

A.F.J.

THE TRADE AND COMPETITIONS.

ROM a recent interview with Major Watling, the general manager of The Cycle and Motor Cycle Manufacturers' and Allied Traders' Union, we vere very favourably impressed by the general feeling f the trade concerning competitions. Despite thenany difficulties under which the makers are now vorking, the motor cycle section of the Union has greed to support all the twenty open events for which he A.C.U. has granted permits. This, of course, loes not mean that all makers will necessarily support Il these trials; it is recognised that certain trials ppeal to certain manufacturers. No doubt those eld in the motor cycle manufacturing centres will eceive greater support than others further afield, lthough it is to be hoped that many will seize the

opportunity of entering in the latter events and so widen the field of their efforts and publicity. Such propaganda work cannot fail to become ultimately of benefit to them.

It is desirable that the public view average performance in these trials rather than assume that, because a certain machine is not entered in a particular trial, perhaps far afield from his district, its makers lack the confidence to enter it. We do not think that the public is prone to draw such conclusions, but there appears to be a tendency among some manufacturers to think such might be the case. No doubt most trials held in the London and Midland districts will be well supported by trade entries, and that all others will receive full consideration on the part of manufacturers.

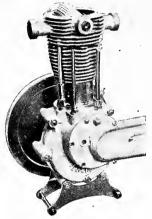

An Oscillating Cylinder Head.

Further Details of the Lightning Valve.

WHILE at the works of Mr. Leopold Ward, experimental engineer,
Harmood Place, Chalk Farm,
London, N.W.1, the other day, we inspected an engine ready for test which was fitted with the Lightning valve described in the issue of The Motor Cycle of December 18th.

of December 1001.

We may remind our readers that the valve consists of what is practically a rocking cylinder head working within a spherically sided chamber and oscillating so as to open and close the exhaust and inlet ports, which are at opposite ends

The Lightning valve engine on test.

(Left) The special cylinder head with the valve tilted to show its construction. (Right) One set of

valve ports will be observed on the right. orifice on the top is for the sparking plug. -

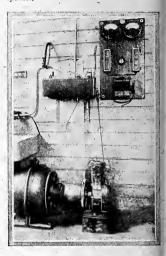

of a diameter. The valve is furnished with a couple of rings, which share a common groove, and is actuated by rockers from a "tramway" cut in the face of the flywheel. A diagrammatic view of the valve is shown in the issue previously referred to, but we are now enabled to illustrate the valve, and also to present a view of the piston head in which the ports may be clearly seen. The engine has already run, and run satisfactorily, but we have received no reports up to the present of the power it has developed. With the exception of the valve, special cylinder head, and valve operating mechanism, the engine is a 23 h.p. Blackhurue

MOTOR (YCLE

Ideal Gas Flow.

It is claimed that a considerable increase in "revs." and power can be obtained, and this should certainly be obtained, and this should certainly be the case, as from the point of view of gas flow the design is well nigh ideal. At the same time it will be interesting to hear how the operating mechanism stands up to the sudden changes of acceleration. The valve, however, is very light, and the movement comparatively sm.ll, so that if any difficulty is experienced in this direction it should be interpretable. not be insuperable.

In addition to any other advantages it may possess, that of mechanical silence is sufficient justification for such a radical departure from standard practice, pro-vided, of course, the rocker gear is silent. The Lightning valve was one of the few really novel and interesting developments shown at Olympia, and its progress will be closely watched by very many motor

A Blackburne engine fitted with the Lightning valve connected up to a testing apparatus at the Leopold Ward Experimental Works.

cushion, and a spring seat. .

It will be seen that the lines of the body illustrated are graceful, and yet, by means of the door provided, access to the locker may be obtained without disturbing the passenger. The body is well upholstered, has a spring-back

An Attractive Sidecar Body:

Comfortable Accommodation for Passenger and Ample Space for Luggage.

WHENEVER a successful design in motor cycle or sidecar has been evolved there has always been a tendency for that design to be followed closely by a large number of makers. The rear locker in sidecars is now regarded. as an essential, but the majority of bodies follow more or less set outlines. A side-car which shows individuality, however, car when shows individuality, nower, is that constructed by Messis. Bright and Hayles, 78, Church Street, Camberwell, London, S.E., who do away with the bulbons back, thereby providing a spacious locker at the rear of the body, which will carry two gallons of petrol, spare tyre, a gallon of oil, and other accessories. Many types of bodies have a fairly large locker at the rear, which is only accessible by tilting forward the back of the seat, which is very annoying, necessitating the passenger getting up if anything is required from the locker.

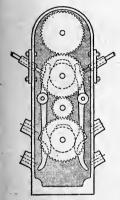

A sidecar body of graceful design.

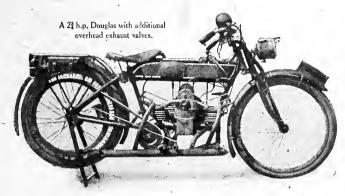

Altering the Makers' Design.

An Enthusiast's Experiment with Extra Exhaust Valves.

KEEN Douglas rider of many years' standing, Mr. W. F. Brook, of Martock, Somerset, has carried out matrock, Somerset, has carried out interesting experiment which, heams, emphasises the value of increased thaust port area. He has fitted an ittra exhaust valve to each cylinder of a 23 h.p. Douglas. Mr. Brook states

How the extra valves are operated by a am on the shaft of the intermediate timing

that he found a slight tendency for his engine to "dry up" or overheat after a prolonged speed burst, and, after a a protonged speed burst, and, after a process of elimination, thought that this was due to imperfect scavenging of the exhaust gases. To obviate this, he designed auxiliary exhaust valves and pockets which take the place of the usual inlet valve cap. The auxiliary valves have the same lift as the standard exhaust valves have the same lift as the standard exhaust valves, but are given a slight lead to prevent the hottest gases im-pinging upon the plug points.

It will be observed, from the accompanying illustrations, that the extra valves are operated by a cam on the shaft that carries the intermediate wheel of the timing gear. Additional rockers are carried on the same pivots as the standard rockers, but in order to accommodate them, it was necessary to inter-step them with the standard inlet rockers.

We are told that the attachment has been in every way satisfactory, and that all signs of overheating have vanished. Tune is also maintained for longer periods, and oil consumption considerably lessened.

Showing how the extra rocker is attached by stepping the existing rocker.

While the attachment is not yet on the market, we understand that Mr. Brook is seriously thinking of manufac-turing it commercially, as it can be fitted to any standard 2½ h.p. Douglas in a few hours by any good mechanic.

CONTROL FOR W.S.R. JET ADAPTER.

HE W.S.R. adapter gives very good results when nsed with a 2½ h.p. Douglas, but is somewhat awkward manipulate. The following handle-bar trol was sent us by a reader, and may useful to other owners of Douglas

A piece of 13 in. brass sheet was cut having a hole large enough to fit ify over the bush in the centre of the led wheel. The end was turned over ittle, drilled, and slotted to take the le and small nipple.

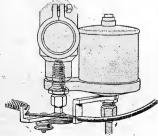

A Simple Adjustment.

Yow, before coupling the lever on to wheel, some means has to be devised arying the range over which the wheel be moved, so that the best positions be found. This was done by drilling in hole in the lever, and by means as small distance piece, a brass bolt, h a milled nut and fibre washer, the r was attached to the wheel. Now, slackening the milled nut, the wheel be rotated independently of the lever, can he clamped firmly when the best ition has been found.

he stop for the outer sheath of the le is also made of 3 in. brass, bent, as indicated, and drilled, and slotted to receive the cable.

It is clamped in place by a thin nut screwing on the same thread as the union nut, which had to be filed down a trifle to admit it.

If there is not sufficient room to take it, a hrass terminal could be soldered on to the bottom of the float chamber, and the outer sheath clamped in the same

The general arrangement of the variable jet control fitted to the Amac carburetter.

way as the wire is fixed to the terminal. A small spring fixed to the cylinders, and the lever providing the means of return, and a lever on the handle-bar, completed the fitting.

In my case, the extreme range of the wheel is an arc of about 30°, whose central point is about 110° from the closed position of the valve; and the lever on the handle-har has a movement of about 45°.

Practical Advantages.

Lest any should say that they dislike having four levers to play with, let me say that I found there are only three positions of the jet lever which need be considered, namely, a small opening for town work, and the full 30° opening for town work, and the full 30° opening for town work, and the time 30° opening for special hills. But, of course, the rider who is willing to take a little trouble over the jet lever will find his trouble amply repaid. My petrol consumption now varies from 130-140 miles per gallon on let had but however and petrol mixture. a half and half benzole and petrol mixture and a still greater mileage is obtained on undiluted benzole, so that the henefit derived well repays the slight trouble of fitting.—X.J.C.

A Commentary based upon Practical Experience and a Study of Overseas Opinions.

A Great Overseas Demand.

THE demand for British motor cycles Overseas is so great that several makers need not trouble at all about the home market if they are so disposed. In fact, -

more than one of the smaller makers of first-class machines, who produce from one to two thousand machines per annum, have told us recently that any one of their Continental distributers would absorb their entire output.

The Needs of IT is satisfactory to note that the majority the Export of makers are allocating a fair propor-Trade. tion of their outputs to Overseas demands, but a few, perhaps, prefer to take the line of least resistance, and give the home market preference. There is, of course, a great temptation for them to do this, because, as one maker confessed to us, a better price is obtained from agents in Great Britain than from shippers, and, in addition, goods for "local" orders do not require special packing cases nor the necessary time-absorbing attention demanded by shippers. Such a policy is very shortsighted and unpatriotic, considering that Great Britain is in need of the export trade. There is a world-wide market for motor cycles, and those who help to meet the immediate demand will surely reap a big harvest later on.

The Big Question of Spare Parts.

WHENEVER British export trade in motor cycles is discussed, the question of spare parts almost invariably crops up. It is a most important problem, and one which

may be difficult to solve. Frequently the good American spare parts service is quoted by Overseas readers, but very different conditions prevail. America is exporting machines of only three or four makes. and, therefore, these firms can profitably send out adequate spare parts stocks. With British machines it is different. There are at least fifty more or less well-known

makers exporting motor cycles, none of which attain the number of a concern like the Hendee Mfg. Co., for instance. Therefore, instead of, say, a dozen chief distributers required by an American firm, most of the British firms employ that number each, so, instead of three dozen stocks of spare parts required by American manufacturers, there are probably over a thousand "sole agents" for British machines, who, to give the same service, each require a stock. 0 0 0

of Firms.

AMERICAN manufacturers have also Amalgamation opened branches in the important Overseas centres from which their distributers are supplied. No single British manufacturer could do this profitably, hence it would appear that it is a matter for the trade as a whole

to consider, in which connection we once more reiterate our suggestion that spare parts depots are established by combinations of firms. Just as the many clubs in England are to-day amalgamating for purposes of running competitions, so should manufacturers combine to establish spare parts depots in the various Overseas markets.

\$ \$ \$

Central Depots for Spare Parts.

Such an idea could be carried out in many ways. For example, small companies could be formed composed of those who export motor cycles to a

certain country. Holdings in such companies would be in proportion to the amount of trade done in that country. Each would contribute and maintain stocks of spare parts for a central depot. Another method

would be to have, one larger company working from a main distributing depot in London, which would supply the distributing depots in various countries according to 'requirements. A seroutlined vice as above is capable of being developed by the British motor cycle trade, and we urge manufacturers to give it their earnest and most considera careful tion.

A YORKSHIRE "ROAD."

"Overseas conditions" abound in many outlying districts in Great Britain. This is a road recently encountered in Yorkshire by a member of The Motor Cycle staff.

JANUARY 29TH, 1920.

BICYCLES. MOTOR

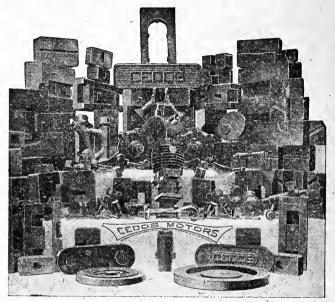

HE thorough reliability of B.S.A. Motor Bicycles under most exacting conditions, was conclusively proved in the strenuous A.C.U. Trials, held last Sept. over the mountainous Llandrindod Wells district of Wales, where B.S.A. Motor Bicycles were successful in securing the Team Prize (the chief award) 3 Gold, 2 Silver, and 1 Bronze, medals. The same sturdy construction and scientific design which ensured their success under these adverse conditions guarantees to vou a trouble-free and reliable mount in a B.S.A.

A Selection of Letters from Readers scattered all over the World.

Gudgeon Pin Fixing.

MR. H. PETHICK, Broken Hill, New South Wales, writes: Being a constant reader of The Motor Cycle for the past four or five years, I thought I would write to you about a most important subject hearing on the design of the motor cycle engine. I refer to the different methods employed in eyele eignie. I refer to the different methods employed in fastening the gudgeon pin into the piston, shown in describing various engines. I enjoyed the article recently about the different magneto drives and position, but I noted amongst the illustrations you never included the Singer magneto drive. I have ridden at different times various makes, but none that I have ridden would compare with the singer for an ellegand magnitude. It was fast and powerful Singer for an all-round machine. It was fast and powerful, reasonable in fuel consumption, and free from that rattle that so many machines seem to develop. It also had decent sized bearings, not microscopic like some I have seen. In fact, the only fault I found with the Singer was that the gudgeon pin used to become loose after a good mileage and through the victor abbranch is marked to be a seen. and turn in the piston, although it was a driving fit when fitted. I rather fancy the idea of fastening the pin in the rod, and allowing it to turn in the bosses of the piston. This idea seems to have been well tried out now. The only other idea that appeals to me is that of a mortised end gudgeon with the special ring to keep it in position. British machines are going strong here, despite Yankee competition, and my next machine will be British also."

Trade Abroad.

"FACTS," Virarajeudrapet (Coorg), India, dilates on the subject of prices, and says: "It is with great pleasure that I read, under the heading 'Profiteering,' in The Motor Cycle of September 11th, that manufacturers of motor cycles have for some time been considering the various steps that can for some time been considering the various steps that can be taken to prevent agents from profiteering when selling machines to the public. The public in England will no doubt feel thankful to the manufacturers and to the Manufacturers' Union if agents are made to sell machines at a reasonable profit, as now contemplated. I would ask our reasonable profit, as now contemplated: I would ask our leading manufacturers to allow their agents in India a fixed discount, or to fix the price of machines, and to get their agents in India to sell them at that price. Of course, we should not grumble if the agents here were to charge us the actual cost of machine—retail price as sold in London, plus freighters, that the cost of machine—retail price as sold in London, plus freighters, that the cost of machine—retail price as sold in London, plus freightage, duty, etc.

freightage, duty, etc.

"I am sure most of our English manufacturers are not aware of the prices charged by their agents in India. Such profiteering will in the long run only result in keeping out the well-tried and time-honoured British products and introducing the cheaper American stuff, as there is no such thing as 353 % duty here on the latter as in England.

"The following list will give you an idea of the prices charged by one of the leading agents in India for most makes of the well-known machines. I do hope our leading English manufacturers will shake off their lethargy and fix the

prices of their machines, which we in India know to be the best the world can produce to-day:

"1919 Models, New Machines. , (Prices do not include lamp or horn, or any other accessory except tools as sent out by the makers.)

 4 h.p. Triumph, three-speed gear 		£150
2. 24 h.p. Baby Triumph, two-speed		£115
3. 4 h.p. B.S.A., three-speed		£150
4. 31 h.p. Ariel, three-speed		£150
 31 h.p. P. & M., R.A.F. model, two sp 	ced	£150
6: 31 h.p. flat twin Humber, three-speed		£160
7. 23 h.p. Douglas		£115
		£150
9. 23 h.p. Invicta-Jap, two-speed		£100
10. 6 h.p. Enfield and sidecar		£240
11. 6 h.p. Enfield and sidecar, electric light	ing	£280
"The agent quotes the above as approximate	te pi	ices."

An "Ideal" Specification.

MR. C. HOLLAND, writing from Ishaporo, near Calcutta, says: "I often note different riders' appeals for an ideal says: "I often note different riders' appeals for an ideal motor bicycle. They differ from mine in a good few details. What I want is a 3½ to 5 h.p. h.o. twin, three-speed gear (all one unit), swivelled from front down tube, divided chain case behind the gear box, drive to be on right-hand side, magneto high up behind the cylinders, or on top, all silent chain drive, clutch on left hand, brake on right-hand side, quick detachable aluminium chain cases, wheels to drop. out the same as the Indian front wheel, back chain wheel to remain on separate ball race on back stays, on removal of the back wheel and connected when together by a, dog clutch, chain cases to be held together by half a dozen small bolts, sprung fore and aft, electric lighting, mechanical oiling; and hand pump reserve or drip feed, inside belt rim brakes, as per B.S.A .- in fact everything to be accessible and quickly detachable, contact breaker, and carburetter adjustable from the right-hand side, and no trouble with sidecar attached.

"I notice in recent issues that some motor cyclists are satisfied with makers' and repairers' courtesy. What about

this?
"I got a 3½ h.p. Douglas through agents in Quetta,
Baluchistan. On receipt I noticed the carburetter to be Baluchistan. On receipt I noticed the carburetter to be cracked The makers promptly sent one out. After three months' riding I complained about on leaking from the valve guides and gear box trouble. I wrote to the Douglas Co. Never addressed them before. They promptly sent me an entire new engine and gear box, and waited about six months for the old one to be returned, through the fault of the shipping agents, and not a bit of a grouse about it either. Mind you, this is not at home, on the spot: all seven to eight thousand miles away, and not a word about trouble or cash."

C. W. A. Korner (7 h.p. Indian), president of the M.C.C. of S. Australia, who rode from Adelaide to Melbourne, 583 miles, in 19 hrs. 35 min., breaking the first official record between the two capitals, set up the week before, by 4 hrs. 47 min., thus winning the Dunlop trophy for the first rider to cover the distance in less than twenty hours.

THE A.C.U. ANNUAL DINNER.

Prince Albert to be Patron of Auto Cycle Union.

Distinguished Visitors.

M UCH has happened in the history of the A.C.U. since the last annual dinner of that body in 1913. Still, many well-known faces were to be seen among the guests of the Royal Automobile Club on Wednesday last week at the thirteenth annual dinner, many of whom had done noble service for their King and country. The chair was taken by the Hon. Sir Arthur Stanley, G.B.E., Ob. the Holl. Sir Arthur Stating, G.B., M. C.B., M. V.O., president of the Auto Cycle Union, and chairman of the Royal Automobile Club. The dinner was a particularly interesting affair for several reasons. larly interesting affair for several reasons. There were many distinguished guests, among whom may be mentioned Maj.-Gen. Sir G. P. T. Feilding, K.C.B., C.M.G., D.S.O. Sir Julian Orde (secretary of the R.A.C. and a vice-president of the A.C.U.), the Mayor of Marylebone (Mr. Duncan Watson), Lt.-Col. A. Hacking, D.S.O., M.C., Brig.-Gen. Sir H. Capel-Holden, K.C.B., F.R.S., and Major Watling (General Manager of the Motor Cycle Manufacturers' Union).

Guests from Abroad.

The diuner preceded the conference of the International Federation of Motor Cycle Clubs, and so several foreign delegates were present: MM. A. Michant and G. A. de Ro representing the Belgian R.A.C., Mr. Graeme Fenton, O.B.E., representing the French Motor Cycle Union, Mr. Frank R. Jones representing New Zealand, and Mr. W. H. Wells America. A most interesting announcement was made by the Chairman after the toast of the King. He pointed out that those present were, of course, aware of the interest the Royal Family took in the sport and prosperity of the community. The King was patron and the Prince of the International Federation of Motor The King was patron and the Prince of Wales vice-patron of the R.A.C., and he was glad to be able to announce that Prince Albert, himself a motor cyclist, had consented to become patron of the Auto Cycle Union, and he hoped to convey the Union's grateful thanks to the Prince for his biggers. for his kindness, and trusted he would occupy the chair at the next A.C.U. annual dinner.

The toast of "His Majesty's Forces" was proposed by Mr. E. S. Shrapnell-Smith, C.B.E., who, in his speech, referred to the excellent work carried out by the Union and its members during the war in the Navy, the Army, and the Air Force. The Union consisted of members mostly on the right side of forty, a large percentage of whom joined up even before war was declared. The war had naturally brought down the Union's revenue, but it had now made a splendid recovery and hoasted of over 60,000 members. It had not only helped the right men to join the Forces, but had helped them when on leave to get them petrol. In return for their services, he hoped that those responsible for the proposed new taxation would place the solo motor bicycle weighing up to 200 lb. in a low classification—in fact, as some recognition of what motor cyclists had done during mostly on the right side of forty, a large of what motor cyclists had done during the war he trusted that it would come under half rates.

under nail rates.

Gen. Feilding, in reply, said of the three Forces mentioned he would confine himself to the Army. His first acquaintance with the A.C.U. was in 1912, when the Union representatives met the War Office and a discussion ensued as to how motor cyclists could be utilised in the event of war, with the result that when war was declared in 1914 a perfect organiwas usual in force, and some 11,500 motor cyclists were enrolled through the A.C.U. alone, showing that the work done in peace was justifiable when war broke out. In peace we must be prepared, and if America and England stood together they

could preserve peace.

A Wake-up-England Speech.

The toast of the Auto-Cycle Union was proposed by Alderman Duncan Watson, Mayor of Marylebone. His only complaint, he said, was that Mr. Shrap-nell-Smith had covered so much of the ground he intended to cover himself. Every sport and industry had its union, and unless its policy was representative and constitutional it could not succeed. The A.C.U.'s policy, he was glad to say, was both. Its age was, he believed, seventeen years, an age always associated with imagination and promise. As the Jockey Club, by its devotion and support of racing, had improved the breed of racehorses, so the Auto-Cycle Union had not only developed the motor cycle, but had sustained and encouraged a great national industry. It had great opportunities and great responsibilities; it helbed a great-mass of people to enjoy it helped a great-mass of people to enjoy a healthy and helpful recreation, and assisted the worker to transport himself to the open country. Among our Allies and foreign representatives the prestige of Great Britain had never been so high.—In the great work of reconstruction all eyes were upon us, and we must go ahead or sink into indifference.

Mr. Watson's was a real "Wake up. England" speech, which he concluded by saying, "May Fortune's golden smile attend every effort of the A.C.U." Mr. A. W. Torkington, chairman of the Union, spoke of the motor cycle and industrial discontent. How, he asked, could a man be discontented when he could leave a city like Manchester, of which-he assisted the worker to transport himself

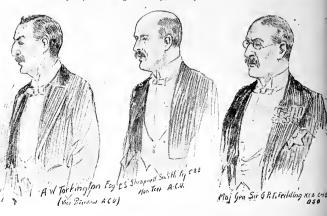

leave a city like Manchester, of which he (the speaker) was a native, and reach our that speaker) was a have, and read out beautiful country. He was glad to say that during the war he had been success-ful in obtaining petrol licences for men working in Sheffield and other industrial

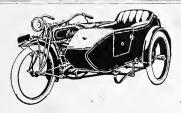

centres.

Financial Position.

As regards the Union's financial condition in 1914, it owed the R.A.C. over £700, which took three years to pay off; it now had thousands invested in War Loan. He referred to Sir Julian Orde and Mr. Armitage, of the R.A.C., as great sources of strength, and Sir Arthur Stanley as a great rock to cling to. The A.C.U. had schemes for the future. It should encourage the cheap and light motor cycle to get the masses out of the towns, a machine which could be bought by the rank and file of working men. It had been suggested that the reason of the existence of the Union was to run competitions and issue bronze instead of As regards the Union's financial con-

In answering this advertisement it is desirable to mention "The Motor Cycle."

The A.C.U. Annual Dinner .-

gold medals-(laughter)-but this was not its main object.

Sir Arthur Stanley, in proposing "The Guests," said he had been compared to a rock, and was not sure if he liked it. Androneda had rather a close attachment to one, and he was sure she did not like it. He spoke of Sir Julian Orde and Mr. Arnitage and their work during the war, of the other gnests, Sir Elmsley Kerr, the press and the assistance they had been to the R.A.C. and A.C.U., paying a great tribute to the newspapers of the country. He also mentioned Mr. T. Clarkson, president of the Society of Antomobile Engineers, Mr. S. Henshaw, and Mr. A. S. Hill, the president of

MOTOR (YCLE

Brig Sen Sie H Copol-Hollin KCH, FRS.

the Motor Cycle Manufacturers' Union. He concluded by referring to the delegates of the foreign motor cycle organisations, and mentioned the glorious stand made by Belgium in the early days of the war, and Col. Hacking, secretary of the Motor Legislation Committee.

Mr. G. A. de Ro, in reply, made a brief and graceful speech in French, telling of an incident in 1914, when the Policies are proposed to the description of the secretary of the secr

Mr. G. A. de Ro, in reply, made a brief and graceful speech in French, telling of an incident in 1914, when the Belgian Army was in a bad way; then came their, friends the British troops, and those were the happiest days of the whole campaigu. As interpreter of the Allied clubs, he thanked Great Britain, King George, and the great British people for saving his country.

people for saving his country.

Col. Hacking, also in reply, paid a humble tribute to the despatch riders. He remembered finding one in France grievously wounded and at the point of death, lying by his battered machine,

who, placing his hand on his waller, could only mirring. Despatches, despatches, before he expired. That was a tribute to the espirit de corps in the D.R.'s. There was the same espirit de corps in the Motor Legislation Committee—a valuable asset to any body or industry.

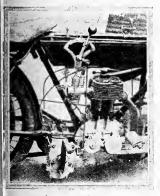

The Rev. E. P. Greenhill then proposed the toast of "The Chairman," mention ing his great work for the British Red Cross Society. When he (the speaker; sought to culist his services, he found Sir Arthur the man to go to. He only wished they saw more of him in the ACM.

Sir Arthur Stanley, in reply, expressed his thanks to the proposer, and mentioned the indefatigable work of the Chairman of the Union and its secretary, Mr. T. W. Loughborough.

Modernising Out-of-date Models.

A MONG the multitudinous queries which reach this office a large number ask us how to fit modern hree-speed gear boxes to an old machine.

Modernising a 1911 model Bradbury. A Binks carburetter and three-speed gear box was fitted.

Looking round the show rooms of Messrs. Wauchopes, Ltd., 9, Shoe Lane, London, E.C.4, the other day, the works manager pointed out to us a 1911 Bradbury, which he had most successfully modernised. This particular machine strongly appealed to us as being an excellent example to show our readers how easily modernisation could be carried out provided the necessary parts could be obtained from the manufacturers. The photograph of the power unit shows a Juckes three-speed gear box and kickstarter, which is made by Messrs. Juckes, Efficiency Works, Bilston Road, Wolverhampton. Suitable fittings for the bottom bracket for this gear box, the works manager informed us, were supplied.

supplied.
The other photograph shows the clutch and chain drive. The original pulley was removed, a complete new boss turned up, and a sprocket screwed up against this. Gear levers are usually designed to

fit on to the top tube, or to the secondary tube of the frame, but in this particular instance this method of fixing was not convenient, and so the lever was botted directly to the tank.

Another interesting conversion has been made to the rear wheel. This was turned completely round, so that the free wheel was on the near side, instead

of on the off side, and the belt rim was changed ov.r. The free wheel was then removed, and in its place a drum was screwed, on which an excellent band brake was mounted.

Transmission side, showing the sprocket screwed on to the special boss.

etrol in France.

The R.A.C. are advising members who itend taking their cars to France to ljourn their visit if possible until the etrol situation is easier. At present, wing to the shortage of coal, there is ig difficulty in the distribution of fuel. certain districts in the South of France e hear that, petrol is almost unprocurile, but this temporary shortage is only a local nature.

iternational Trials. -

At a F.I.C.M. gathering, last week, r. T. W. Loughborough, secretary C.U., referred to the Freuch Inter-tional Trials. The first trial was held 1913. The 1914 Trial was abandoned the eleventh hour, when war broke the secretary of the companyity of the secretary of the secretary of the secretary in the secretary of the secretary tt—many of the competitors being at renoble, the centre of the trial, and id difficulty in getting back to Eng-nd. In fact, several had to abandon eir machines there. The Anglo-Dutch rial is another international trial which very popular. It was suggested that, ter the French event, competitors onld proceed to Holland for the Angloutch Trial, and that the A.C.U. should be a supple to the competition of fer a special prize to those competitors ho had a clean sheet in (1) the French x Days, (2) the run from Paris to olland, and (3) the Dutch Trial. Mr. H. Wells suggested that the technical pers should ask their readers to ballot r the four private owners and four ade riders to represent England in the st-mentioned event.

ore Motor Cyclists than Car Owners.

There were only 116,600 motor cycles gistered in Great Britain and Ireland to March, 1919-a figure less than e weekly circulation of The Motor ycle. In 1915-16 158,000 motor cycles ere licensed, and it is expected that hen the figures for March, 1920, arc railable, it will be found that the 1915-figure will be at least equalled. In 1915-16 there were 9,200 fewer cars

gistered than motor cycles, while the 19 figure shows 3,600 motor cycles in

cess of cars. At the last census taken in this untry, the population was given as ,370,530, and, taking the 1915-16 ures of motor vehicle licences, it is en that one out of every 125 was the mer of a car, motor cycle, or hackney hicle. The latter type numbered ,400 in 1915-16 and 43,400 in 1919. It is estimated that by March, 1921,

ere will be at least 200,000 car licences.

hat will be the motor cycle figure?

THE NEXT STAGE!

MOTOR CYCLISTS interested

the forerunner of all motoring fournals. Founded in 1895, it remains the largest and most successful automobile paper, and enjoys the greatest circulation. It is universally accepted as the representative British motoring journal,

A.C.U. Consul in Coventry District.

Mr. T. Mallilieu, the hon, secretary of the Coventry branch of the N.M.C.F.U., has been appointed A.C.U. consul for Coventry district.

Antidote Against Bolshevism.

Speaking at a dinner, last week, at which all the foreign delegates of the F.I.C.M. were present, Mr. W. H. Wells, of Indian fame, said that the motor cycle was the surest antidote against Bolshevism.

The Scottish Show.

What may be said to indicate the trend of public feeling-or rather public finance—is the fact that the cycle cars and light cars attracted more attention at the Scottish Show than the larger cars. There were no motor cycles at the Show. .

A scene during the recent Presidential Election at Versailles. It will be observed that the despatch rider who is, incidentally, posed before a statue of Louis XIV., is mounted on a B.S.A., to which is attached a French military pattern sidecarrier.

Benzole Un.

N.B.A. henzole is now 3s, Id., to which figure it was raised last Monday.

The Anglo-Dutch Trial.

This event has now been arranged to take place from August 1st to 4th. Holland is the venue this year. The trophy—or rather the N.M.V. Beker won by the British team in 1913, was on view at the A.C.U. dinner last week.

Mr. George Robey as Auctioneer.

On Wednesday of last week Mr. George On Wednesday of last week Mr. Coorge Robey, O.B.E., gave his assistance as auctioneer at a sale at the premises of Messrs. Knight, Frank, and Rutley, Lon-don, W.I., in selling a selection of articles for the benefit of St. Bartholomew's

There came under Mr. George Robey's hammer a Coulson two-stroke, which went for sixty-five guineas; an Albion two-speed gear box presented by the Albion Engineering Co. Ltd., 94 10s.; a number of smaller and money contributions. tions were also contributed.

An Informal Dinner.

Unfortunately, the delegates to the Congress of the Federation of International Motor Cycle clubs from Holland and Switzerland were unable to attend the annual dinner of the Auto Cycle Union on Wednesday last, so at the conclusion of the congress on Thursday, they were invited to an informal dinner by the chairman of the A.C.U. on Friday last. It was a most enjoyable little gathering, totally without ceremony. There were present Mr. A. W. Torkington, chairman of the A.C.U. (in the chair), M. Jules Neher (Union Motocycliste Suisse), Mr. G. E. Sharp (Treasurer F.I.C.M.), Mr. W. J. Becker (Konninklike Nederlansch Motorwielrijdes Vereenigen), Major Dixon Spain (assistant secretary A.C.U.), Mr. T. W. Longhborough (secretary A.C.U.), Mr. E. M. P. Boileau (A.C.U.), Mr. Nico Jannink (K.N.M.V.), Mr. -W. H. Wells (M.T. and A.T.A. of America), and M. G. A. de Ro (R.A.C. of Belgium). by the chairman of the A.C.U. on Friday

The Moulders' Strike Ended.

After holding up the engineering industries for over three months, the moulders' strike was concluded by an agreement reached last week. A large number of men resumed work on Monday of this week, but it will be several months before the ill-effects of the strike disappear. So far as the motor cycle industry is concerned, the loss must have been heavy, and probably outputs of the present financial year have been reduced at least 20%. The public will be called upon to pay extra for their machines, because the cost of a machine is considerably influenced by overhead or establishment charges. If production is reduced, then a lower number of machines has to bear these charges, in addition to any increased cost of production caused by the labour rates. concerning which the strike was organised. Decreased ontput means also that demand will be greater in proportion, which also influences prices, both of new and second-hand machines. Finally, the influence of the strike will be felt at the T.T. Races, for a number of manufacturers have had to abundon the idea of entering.

World's Motor Cyclists' Representatives Meet in London

The First Post-war Conference of the Federation Internationale des Clubs Motocyclistes.

THE F.I.C.M. IN CONFERENCE.

Reading from left: Nico Jannink (Holland); W. J. Becker (Holland); A. V. Torkington (Chairman A.C.U.); H. P. E. Harding (A.C.U.); W. H. Wells (America); G. F. Sharp (Treasurer F.I.C.M.); Hon. Sir Arthur Stanley (G.B.E., C.B., M.V.O., President F.I.C.M.); T. W. Loughborough (Sec. F.I.C.M.); Rev. E. P. Greenhill (Chairman Competitions Committee, A.C.U.); Graeme Fenton (France); A. Michant (Belgium); F. A. Jon is (New Zealand); Jules Neher (Switzerland); E. M. P. Boileau (A.C.U.); Maj. Dixon-Spain (Assist. Sec. A.C.U.)

first post-war congress of the HE first post-war congress of the Fédération Internationale des Clubs Motocyclistes was held at the Royal Automobile Club on Thursday last, the 22nd inst. Before the meeting we had had several interesting talks with the representatives of various Continental motor cycle organisations.

Talks with the Delegates.

Belgium sent two especially interest-ing men-Messieurs A. Michant, secre-tary of the Royal Automobile Club of Belgium, and G. A. de Ro, a member of the committee of the same club and a member of its board of directors. Of these, M. Michant is a great devotee of sport, and before the war he used to visit this country practically every week in connection with swimming, boxing, football, etc. He spent the whole of the period of the war in Brussels, and was particularly eloquent concerning the horrors perpetrated by the Huns on his fellow-countrymen. He himself was put in prison because he could not produce in prison because he could not produce certain cars which he was ordered to requisition. His colleague, M. de Ro, has been a motor cyclist since 1904. He served with the Belgian Staff, and was in charge of seven curs. He then served with various regiments and units, and finally became a liaison officer at the Air Ministry in London. During his period with the Belgian Army he had various British motor cycles under his care, including the Enfield, James, and B.S.A. He greatly admired the Scott machine guns. Asked if there would be any motor cycle racing in Belgium this year, the Belgian delegates informed us that they did not think so, but they had a good course near

Dinant for 1921. The prospects of the industry and pastime in Belgium are particularly rosy.

France was represented by Mr. Graeme Fenton, an Englishman, who has spent most of his time in that country. He is a keen sportsman, an active motor cyclist, and has done much valuable work in bringing the two countries together in the motor cycle movement. He has helped Englishmen who have entered competitions in France, and has belped Freuchmen to develop their machines on British lines, and to run the sport according to English ideas. He was formerly connected with the Clément firm, but since they have ceased to manufacture motor bicycles he has joined the French manufacturers of the A.B.C., and will be riding one of these machines in the Paris-Nice Trial. He has long been connected with the F.I.C.M., and has done very valuable work on its behalf.

As a contrast to Belgium, where there are a hundred British machines to one of Belgian make, and British machines are in great demand. Mr. Fenton told us that there are comparatively few British motor cycles in France, but that the industry is going ahead, the workman has settled down to work hard, and prospects gener-

ally are brighter.

Switzerland was represented by Switzeriand was represented by M. Jules Neher, a great admirer of this country. He also is an active motor cyclist, and devoted to the Motosacoche of the Mann factory, of which firm he is managing director. He prefers a motor cycle to a care. Excelunation to the statement of the same for th to a car. For a long time he has taken an active part in the Swiss Motor Cycle Union, of which he is president. He is a keen follower of all competitions, and

does his best to see that the rules are established on a fair basis so as to encourage the production of the best possible machine. M. Neher is frequently in this country and follows the movement with the greatest enthusiasm. Impartial to a degree, a thorough sportsman in the best sense of the word, he is a real asset to the International Federation.

Dutch Representatives.

Holland was represented by Mr. Nico Jannink and by Mr. W. J. Becker, the latter an enthusiastic rider of an American Excelsior. Both these gentlemen informed us that motor cycling was booming in the Netherlands, but that motor bicycles were exceedingly hard to obtain. British machines are in great demand, but there are many American mounts on the road. The trade in 1920 bids fair to be most prosperous, provided the supply could meet the great demand. These gentlemen told us that track racing was popular on a 500 metre wooden track in Amsterdam, and they were greatly looking forward to the Anglo-Dutch trial this year.

From these interviews with the delegates representing Holland and Belgium, it will be seen that the demand for British-made motor cycles in these countries is enormous, and if British prestige is to be maintained it is up to every man in the industry, from the managing director to the humblest worker, to do his best to see that production is such that this great demand

may be met.

Views from the Antipodes.

Our final interview was with Mr. Frank R. Jones, who represented the Pioneer Sports Club in Christchurch,

World's Motor Cyclists Meet in London .-

New Zealand, and attended the Congress unofficially. His club was a prosperous one, and consisted of some 300 members, but of these 50% had been lost during the war. Talking of the conditions in the South Island, he informed us that there were quite good roads, a longer summer and a milder climate than in England; there was no excessive heat nor cold, and the conditions for motor cycling were ideal. There were 10,000 motor cyclists in Christchurch, and motor cycling is rapidly increasing. He concluded by telling us, that New Zealand was doing three times more motor cycling business in proportion to its population than any State in the U.S.A. or the British Empire.

The Congress.

The Congress was held at 2.30 p.m., in the Committee Room of the Royal Automobile Club, under the presidency of the Hon. Sir Arthur Stanley. The Chairman welcomed the delegates, and stated that he was pleased to say that happy and peaceful times prevailed once more. After the minutes of the last Congress, held in Paris, on October 25th, 1913, were read, the Hon. Sir Arthur Stanley was re-elected president, while MM. G. A. de Ro (Belgium), J. Neher (Switzerand), and G. Longuemare (France), were elected vice-presidents; Mr. T. W. Loughborough being re-elected secretary, und Mr. G. F. Sharp treasurer. It was lectided to hold the next conference in Paris, about the 1st or 2nd of August, und at the conclusion of the International Six Days Trial.

Germany and Austria.

An interesting discussion then followed is to the position of the Imperial and doyal Automobile Club of Austria and he German Club as constituent bodies if the Federation. The suggestion of the Ealiman that these bodies no longer elonged to the Federation, as they had out paid their subscriptions, but that heir applications for re-election might

be considered after Austria and Germany had been admitted to the League of Nations, was adopted.

M. Jules Neher spoke at some length on this subject, and concluded by saying that he would be happy on his return to Switzerland to place the declsion arrived at before the Swiss Motor Cycle Union.

Trade Control in U.S.A.

Another interesting point was brought up by Mr. W. H. Wells, who applied for the membership of the newly constituted body representing motor cyclists in the U.S.A. taking the place of the F.A.M., which had now renounced its rights. This was the Motor Cycle and Allied Trades' Association, whose secretary, Mr. W. H. Parsons, was a man entirely unconnected with the motor cycle industry. It was rather curious, he said, that a body composed of the trade held this position, but it had carried out its duties very successfully and its rules were almost word for word the same as those of the Auto Cycle Union. It was finally decided that this body should be admitted to the Federation on its status being confirmed by the Automobile Club of America.

The International Trials of 1920 and 1921.

The promotion of the 1920 International Trial by the Union Motocycliste de

M. Jules Neher, of the Motosacoche Co., Geneva. France at Grenoble from July 25th to August 1st was then confirmed, and it was next decided to hold the 1921 International Trial in Belgium.

International Classification

The next two items on the agenda dealt with the rules for the classification of motor cycles in open competition, and international rules governing the recogni-tion of records. A long discussion then ensued, the first part of which dealt with such details as the definition of a motor cycle, the definition of a cycle car, the size of tyres, mudguards, and luggage carriers to be allowed on various sizes of motor cycles in open competition, and similar details. No definite decision was come to, and while it is expected that the lines followed by the A.C.U. will be adopted, it was agreed to refer the matter to an International Competition Rules Sub-committee, consisting of Messrs.
Graeme Fenton (France), Jules Neher
(Switzerland), W. J. Becker (Holland),
G. A. de Ro (Belgium), and Mr. T. W. Loughborough, secretary (Great Britain). This body will also have to decide the question of records, and it was generally agreed that the A.C.U. procedure as regards the taking of the mean of two attempts should constitute the record up to records of one mile.

Towards the end of the meeting the secretary read letters from clubs in countries which were not members of the Federation. The Royal Automobile Club of Spain replied that there were plenty of clubs in that country, but none sufficiently strong to be representative. M. Neher then made the happy suggestion that a union of Spanish clubs should be formed. The reply from Norway was to the effect that the matter had been handed over to the Motor Cycle Club of Norway, whose reply was awaited. No answer had been received from Sweden. The Danish Club replied that it regretted the delegate could not attend.

The meeting concluded with a financial statement of the Federation.

M. G. A. de Ro, member of the R.A.C. of Belgium.

M. Michant, sec. R.A.C. of Belgium.

Mr. Graeme Fenton, of the Union Motocycliste de France.

Mr. Frank R. Jones, of Christchurch, N.Z.

NATIONAL MOTOR CYCLISTS' FUEL UNION.

Birmingham Branch.

The Birmingham branch of the LM.C.F.U. is holding a concert in the dibion Hotel, Livery Street, Birmingham, 5-morrow, the 30th, at 7.30 p.m. A good rogramme has been arranged, and all old, ew, and intending members are invited. Ion. district secretary, Mr. F. Murray, trathmore, Wharfdale Road, Acoeks reen, Birmingham.

Leeds Branch.

A highly successful dinner was held at the Hotel Metropole, Leeds, on Wednesday of last week. Mr. L. W. Hague, vice-president, presided. Mr. L. Wozencroft, vice-chairman of the National Executive, was the guest of the evening. The hon. secretary of this branch of the N.M.C.F.U. is Mr. T. W. Lancaster. 7, Evelyn Street, Leeds.

Coventry Branch

A whist drive and dance has been arranged for Wednesday, February 4th, at I.L.P. Rooms, at 7.30 p.m. Tickets may be obtained from the committee or the secretary, Mr. T Malillieu, 70. Gorton Road, Coventry.

Club News and Fixtures will be found on page 128.

CI

CLUB NEWS.

Renewed Activity and Several New Clubs.

Bristol M.C.C.

The date of this club's speed trials at Weston has been changed from May 22nd to May 8th.

A New Club for Barnsley.

Mr. J. S. H. Davies, of Newholme, Pollitt St., Barnsley, and several motor cyclist friends, are desirous of forming a club in their district, and invite local motor cyclists to communicate with Mr. Davies

Ilkeston and District M.C.C.

The annual meeting and dinner will be the annual meeting and dinner will be held on Tuesday, February 17th, at the headquarters. Ladies are cordially in-vited. Tickets, 5s. each, from the hon-secretary, Mr. W. Thornley, 1, Station Road, Ilkeston.

A Bromsgrove Club?

Motor cyclists who are anxious to help to form a club in Bromsgrove and the to form a cub in Bronsgrove and the surrounding district should communicate with Mr. P. J. Hayward, 71, Grantham Road, Sparkbrook, Birmingham.

Cumberland County M.C.C. Lectures.

Mr. A. P. Young, of the British Thomson-Houston Co., Derby, recently delivered a lecture on magnetos before members of the Cumberland County Club, who proved to be a keenly appreciative audience.

A Club for Pembrokeshire.

A club for motor cyclists in the county of Pembrokeshire is under consideration, and any prospective members should communicate with Mr. W. L. S. Ludwick, 2, Meyrick Street, Pembroke Dock, or Mr. W. Fox, c/o Greens' Motors, High Street, Haverfordwest.

Sheffield and Hallamshire M.C.C.

The annual general meeting of the Sheffield and Hallamshire M.C.C. will take place on Thursday, February 5th, at headquarters, the Angel Hotel, Angel Street, at 8 p.m., when it is hoped all members will assist the committee by attending and giving their views on the 1920 programme.

Bedford and District M.C.C.

A meeting will be held at the Rose Hotel, High Street, Bedford, on Saturday Holel, High Street, bedford, on Saturday evening next, the 31st inst., at 7.30 p.m. All local motor cyclists—ladies and gentlemen—interested are cordially invited to attend. There is ample accommodation for all motors and a private entrance to the club room.

Leicester and District M.C.C.

The above club has been revived under the management of a keen, hardworking committee and officers. The revival of the club is to be marked by a smoking concert at the club headquarters, the De Montfort Hotel. Wellington Street, Leicester, on Thursday, February 5th, at 7.15 p.m., to which all motor cyclists or those interested in the movement are cordially invited. The hon, secretary is Mr. F. Leslie Barratt, 78, St. Peters Road, Leicester.

Future Events.

Jan. 30.—N.M.C.F.U., Rotherham. Meeting, Y.M.C.A., 730.
Jan. 30.—Reading and District M.C. and L.C.C. General Neeting, 8th Motel, 730 p.m.
Jan. 31.—Bedford and District M.C. Son Meeting, 8th Jan. 31.—Bedford and District M.C.C. Meeting, 8th Jan. 31.—Bedford and District M.C.C. Sonting Run under "Colonial" Conditions. Sonting Run under "Colonial" Conditions.
Feb. 3.—Dorchester M.C.C. Meeting, King's Arms, 730 p.m.
Feb. 4.—N.M.C.F.U. (Coventry). Whist Drive and Feb. 4.—N.M.C.F.U. (Coventry). Whist Drive and Feb. 5.—Sheffield and Hallamshire M.C.C. Annual Feb. 5.—Sheffield, and Hallamshire M.C.C. Annual Feb. 6.—Nottingham and District M.C.C. Reunion Dinner, Webbee Ham. M.C.C. Annual Dinner, Grosveror Restourent, 7 p.m.
Feb. 11.—Exercit M.C. and J.G.C. Annual Dinner, Feb. 11.—Rechester, Chatham, and District M.C. Whith Drive and Dance, Queen's Holl.
Feb. 11.—Rechester, Chatham, and District M.C. Whith Drive and Dance, Queen's Holl.
Feb. 11.—Rechester, Chatham, and District M.C. Melling and Dinner of Meeting and Dinner of M

York and District M.C.

The York and District Motor Club held-a supper and concert on Wednesday of last week, at the Windmill Hotel, over seventy members attending. Mr. G. A. Reed, the hon. secretary, gave a brief review of the past year's work, and of some of the events for the coming

Western M.C.C. (Glasgow).

The Glasgow Western M.C.C. holds its first annual dinner and presentation of prizes in the Grosvenor Restaurant, Glasgow, on Saturday, February 7th, at 7 p.m. The tickets can be obtained from the secretary, Mr. J. Robinson, 1, Yarrow Gardens, Glasgow.

Dorchester M.C.C.

With the object of reviving the above club. a meeting will be held at head-quarters, King's Arms Hotel, Dorchester, on Tuesday, February 3rd, at 7.30 p.m. All old members and any interested motor cyclists in the district are invited to attend or communicate with the secretary. Mr. Arthur G. Stone, Lloyd's Bank House, Dorchester.

Reading and District M.C. and L.C.C.

A general meeting of the above will he held at the Ship Hotel to-morrow, the 30th inst., at 7.30 p.m. Members are particularly requested to attend for the purpose of electing officers and committee, passing balance-sheet, and discussing the general future of the club. Hon. secretary: Mr. T. Len. Morley, 40, King's Road, Reading.

North-Western A.A.

The above Association, which constituted the North-western Centre of the A.C.U., suspended activities early in 1916, and the co-trustee, Mr. C. E. Kettle, is now anxious to get into touch with the honorary secretaries of the clubs interested, with a view to calling a meeting at an early date, either in Manchester or Liverpool, with a view to immediate reconstruction. Mr. C. E. Kettle's address is 34, Chester Road, Southport.

Wakefield and District M.C.C.

The annual general meeting of the Wakefield and District Motor Cycle Club was held on January 19th at the White Horse Hotel, when the officials were duly

elected for the ensuing year.

At the termination of the meeting a presentation was made to the hon. sec. (Mr. S. E. Wood) of a silver-plated spirit flask as an appreciation of his services.

Sutton Coldfield and North Birmingham A.C.

The above club are holding a Panto-The above clib are holding a Fallu-nime Night at the Alexandra Theatre on March 8th. They have already in-vited all the Midland motor clubs to join them, and named the event the "Midland Motor Cyclists' Night."

The social secretary is Mr. Sam Hall, 24, Frederick Road, Gravelly Hill, Birmingham.

Nottingham and District M.C.C.

The Nottingham and Dis. M.C.C. dinner will take place at the Welbeck Hotel on February 6th, and not at the Albert Hotel, as first announced. An invitation is extended to all local motor cyclists. The sale of tickets closes on February 2nd. Tickets, 10s. each, may be obtained from the hon. secretary, Mr. J. Simmonds, 10. Cranmer Street, and from all the local garages catering for motor evelists.

Amalgamation of Clubs in Durham District.

A general meeting of the Durham and Dis. M.C. and the Chester-le-Street M.C. was held on January 20th. It was decided that the two clubs should amalgamate, and that other local clubs be invited to join, so as to have one strong club for Durham and District, with head-ouarters at the Neville's Cross Hotel.

Plymouth and District M.C. and L.C.C.

The annual general meeting of the above club was held at Genonis Café, Plymouth, on January 14th, and was particularly well attended, the interest shown boding well for the prosperity of. the club in the coming year.

It was decided that the club should

become affiliated to the A.C.U.. The secretary is Mr. Lionel B. Jackson, Langham House, Plymstock, S. Devon.

Mid-Bucks M.C.C.

It is the intention of the committee of the above club to hold the annual general meeting, followed by a dinner, on February 26th, at the Bull's Head Hotel, Aylesbury. General meeting at 6 p.m. Dinner at 7 p.m. Motor cyclists will be heartily welcomed, as it is hoped to secure a successful season for 1920.

A New Club for Newcastle-on-Tyne.

At a meeting of about sixty of the sporting cyclists who had offered their services to the nation, it was decided to form a motor cycle cluh, to be called the Northern Counties M.C. A com-mittee was formed with Major Anderson as chairman.

The hon. secretary is Mr. J. M. Livingston, 160, Portland Rd., Newcastle-

TAXATION

A Possible Weight Basis for Motor Cycles.

S^o far as motor cycles are concerned, we are not sure that the abolition of the petrol duty, which the Chancellor of the Exchequer will, of course, announce in his Budget speech, will be an unmixed evil. We most naturally anticipate in place of it a somewhat higher annual licence fee on the machine, but so long as that fee is not fixed at

an excessive figure, we may not, under the new taxation regulations, be in a position appreciably worse than we are to-day.

At last week's A.C.U. annual dinner one of the speakers mentioned that a fair tax per year on a light solo machine would be 30s. We think it quite possible that this sum will be agreed to by the Government. If it is, we shall, as compared with the old licence fee of £1, be 10s. to the bad, but against that 10s. we may set off the saving of 6d, on every gallon of petrol we use. It would on this calculation appear that, after we have consumed twenty gallons, we shall begin to improve on matters as they are to-day.

A higher tax will, we anticipate, be exacted on the heavier class of solo machines, and one still higher on sidecar outfits, but if the figures we have here mentioned in connection with these two types are agreed to by the Treasury, we shall not have much cause for complaint, always bearing in mind that the licence fee will be in substitution for the present

impost of 6d, per gallon on petrol.

One decidedly bright spot is the probability of quarterly licensing being sanctioned; under that system, if the rider does not intend to use his machine for the period of three months, he need not

license it for that time.

The latest reports concerning the proposed new taxation of motor vehicles are such that the majority of motor cyclists may be led to suppose that riders of single track machines and sidecars will be taxed on the same basis as cars. An impost of £1 per horse-power in the case of private cars, it is said, will be a feature of the new scheme, which abandons the fuel tax and compounds it with a flat rate according to power. Whether such a basis would be fair to motor cycles would depend upon the formula used to calculate horse-power The present Treasury rating is grossly unfair to motor cycles, as it takes into account bore only, and cars have been developed on these lines, and generally have small bores in proportion to the stroke.

The unfairness of the present Treasury rating, as applied to motor cycles, may be gathered from the fact that a motor be gathered from the fact that a motor cycle single-cylinder engine with a bore over 80 mm. is rated at over 4 h.p. Certain two-cylinder light cars with engines around 1,000 c.c. are rated at 6½ b.p., while a J.A.P. 8 h.p. twin with an equal capacity is 9 h.p. An old four-cylinder F.N. (under 500 c.c.) becomes 6.86 h.p., and a 23 h.p. Douglas 4½ h.p. Thus at 81 to the provincial of the control of the control

Thus, at £1 per h.p., practically all single-cylinder sidecar machines would be £10, F.N. four-cylinder £7, and 23 h.p. Douglas £5.

TO LAND'S END AND BACK. BATH

MEMBERS of the Bath and West of England M.C. are to be congratulated on their enthusiastic support of the club trial held on Friday and Saturday last to Land's End and back.

Of the twenty-four entries twenty started on the long journey against a westerly gale. There were seven solo iders, one each Rudge-Multi, Levis, Pearson and Sopwith, Norton, and three Douglas lightweights. Of the eleven side car outfits there were two Indians, one Enfield, one Norton, and six Douglas. The ight cars that finished the course were Singer and a Douglas.

The first competitor, Mr. C. B. New-

man, left Queen Square on the Singer car at four o'clock on Friday afternoon, but he retired with gear trouble in the neighbourhood of Exeter. The other competitors followed at three minute intervals, and got well away into Devonshire with one or two exceptions, but the wild weather and atrocious roads accounted for many retirements. Ultimately, two riders only reached Land's End. They were E. G. Fery (4 Douglas sc.) and E. Colmer (2) Levis. The latter had retired somewhere on the return journey. Fery made good running, although somewhat behind time, but, by extraordinary misfortune, his big end bearing seized within ten miles of the

finish, no doubt due to hard driving in the attempt to make up time.

The large crowd which assembled to see the finish had to go away disappointed, as except for two or three riders who had not completed the full distance no one arrived back at the starting point. A schedule speed of 20 m.p.h. average running time for 416 miles on the route, with fifteen hours night riding included, is, undoubtedly, a very stiff proposition at this time of the year. Nevertheless, the enthusiasm displayed in Bath, both by members and spectators, augurs well for the future of this sporting West Country

PROGRAMME OF THE PARIS-NICE TRIAL.

THE following are the arrangements made by the organisers of the Paris-Nice Trial, which takes place on

ebruary 13th to 16th.

February 16th to 16th.
February 11th: Weighing in Laboraory, the Automobile Club of France,
soulevard Bourdon, Neurlly, 6 p.m. Reeption at the offices of the Petit Journal,
9, Rue Lafayette, Paris, where there vill be an explanation of the regulations o the French, British, and Italian cometitors

February 12th: Conclusion of weighig in. Afternoon: All the competitors vill start for Montgeron, where rooms have been booked for all foreign competitors. February 13th: Paris-Dijon, starting

February 14th: Dijon-Lyons, starting

5 a.m. February 15th: Lyons-Marseilles, start-

ing 5 a.m.
February 16th: Marseilles-Nice, start-

February 17th; On the Promenade des Anglais, starting from cold test and brake test: Afternoon: Conclusion of trial and examination of machines. Evening: Bal Masqué at the Opera, Nice.

February 18th: Competitors are free to explore the Riviera on their machines. February 19th: Nice-La Turbie Hillclimb. This is a separate competition

for special prizes and cups. British competitors who want to go to

British competitors who want to go to the Bal Masqué or show places of Nice are advised to take evening dress. Luggage for Nice must be handed to the depot of the Voyages du Chemin, 10, Cité Moynet, Gare de Lyons. Com-petitors can obtain this luggage from the Nice depot of the Voyages du Chemin 16, Avenue Felix Faure, Nice, on the 16th February. 16th February.

BIRMINGHAM M.C.C. ANNUAL DINNER.

N Saturday last the Birmingham M.C.C. held their first post-war annual dinner at the Queen's Hotel, irmingham. Some eighty-odd members nd visitors were present, and the gather-ig was presided over by Mr. E. R. yeett, while quite a social touch was nt to the occasion by the presence of veral ladies.

After the loyal toast had been drunk, Mr. Charles Hyde, of the B.S.A., proposed "The Club," and touched on the difficulties of manufacturers and the need for increased production.

Replying for the club, Mr. E. W. Winchele gave a short account of the sound position of the club, both financially and numerically. The prize list was the

largest in the history of the club, and was valued at over £300.

was valued at over 2500.

Maj. R. V. C. Brooke then proposed "The Visitors," and Lt.-Commander G. Pierce, of the A.C.U., replied.
Mr. F. E. Baker, in proposing "The Press," gracefully acknowledged the services rendered, and Mr. A. D. Arter then proposed the health of the Chairman.

Some Light on a Phenomenon Occasionally Experienced by Track Riders.

N a recent morning, some friends and I armed ourselves with a surveyor's tape and stopwatch and at dawn sallied forth for a test. Our destination was about ten miles away, where there was a dead straight road whose surface was practically new Tarmac. We selected a stretch between two almost imperceptible elevations situated so that a clear view of approaching traffic (if any) was assured to the time-keeper and starter at their respective ends and measured carefully a distance of 660 yards.

In one of the tests I noticed a most decided attempt on the part of the steering to defy my control as the pace increased, so I experimented by gradually closing the throttle and releasing the clutch. This had the desired effect of steadying the machine.

What Happened.

On a further test at a fair rate of speed the front wheel began to oscillate laterally in spite of my attempts to steer a straight course. Releasing the clutch gradually had apparently no effect. From previous experience of speed wobble, I decided not to apply the brake, but slightly and slowly closed the throttle.

The oscillations, however, increased in amplitude, until the machine occupied practically the full width of the road, and I awaited the result.

The machine seemed to slide from under me and my shoulder grazed the ground. A moment later I was sliding bodily on my side watching a shower of sparks in my vicinity, caused by the abrasion of the nut on the near side front footrest.

My own injuries were confined to a few very slight skin abrasions on the knuckles, a bruised elbow and hip, and torn clothing.

We examined the food to try and find a cause of the mishap. The slightly greasy state of the surface accounted for the comparative lack of damage done, but the tyre marks were a source of surprise.

Seventy-four yards from the point where the machine stopped, we saw where one of the tyres had commenced to sideslip. First to the amount of about two inches, then a couple of yards further about four or five inches, increasing at intervals until sideslips of three to four feet were plainly visible before the final slip of twenty yards in length where the machine had evidently progressed sideways.

Scratches caused by footrest nuts were in evidence about thirty yards from the commencement of the skid marks, alternately on either side of the marks until the final slip.

My personal skid mark was fifteen yards in length

measured by the road grease displacement.

The figures may be taken as correct, being measured immediately after the spill: A singular thing is that the opposite side footrests should have touched the ground alternately several times. This points to the fact that some dynamic influence was at work more powerful than the gravitational effect of the weight of the machine, which did more than restore it to the vertical position, even after a succession of sideslips.

We intend to dismount the steering head, measure the steering angle and fork offset, and ascertain the weight on each wheel with both riders mounted to see what difference exists in weight distribution with tall and short riders. The handle-bars were wide and fairly low, similar in dimensions to a W.D. Triumph.

Riding Experience.

As regards the question of riding experience, my friend has the benefit of some Brooklands training, whilst I have only been riding since 1899, and naturally have a lot to learn yet. Incidentally, in the early days of variable gears, I rode almost every make of machine, new ones and old crocks in all weathers and on all roads.

Why could I not manage that 6 h.p. twin? My own theory is that the front wheel is out of lateral balance, much in the same way as a two-throw crankshaft is, and at high speeds it attempts to revolve around its centre of gravity which does not lie on the hub spindle centre. This tends to cause a corresponding reaction of the hub spindle, and thence of the forks.

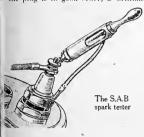

In the case of a fairly heavy tyre having light and heavy places in the side walls, it is quite conceivable that the disturbing action must attain a very high value at high speeds, especially when it is remembered that the disturbing action varies as the square of the speed, being two and a quarter times as much at sixty miles per hour as it is at forty miles per hour.

I. COHEN

HE S.A.B. SPARK TESTER

THE S.A.B. spark tester consists of a glass vacuum tube enclosed in a metal receptacle to protect it, with opening so that the tube can be clearly Within the tube are two platinum ectrodes through which the spark undle and a terminal for connecting up e plug terminal, and a small lead to the etal terminal which comes into contact ith any convenient metal part of the

By means of the S.A.B. spark tester, it easy to judge the condition of the sparkg plug and the nature of the mixture. the plug is in good order, a brilliant,

ep purple spark will be noticed; if e points are too far apart, a weak pink ark is seen; if the insulation of the ug is cracked, an irregular spark is sticed; in the case of a sooted plug, a eak spark is all that can be detected,

d if the plug is really dly sooted up no spark

pears at all. The tester is useful not ly for diagnosing faults the plug, but in the agneto, too. One of the vantages of the tester that it can be used witht the necessity of reres. The protecting se is made of non-oxidisg metal, blackened in-le, so that the spark can

clearly seen even in ight daylight. It is ld in a wooden tube, so at it can be safely put a tool kit, and cannot me to any harm. The device under review

handled by The S.A.B. ark-Tester, 133, Broadway, Crickle-od, London, N.W.

CONCEALED SIDECAR HOOD AND SCREEN.

N ingenious sidecar hood and screen have been invented by Mr. G. W. Davis, 35, Britannia Road, Norch, the assistant managing engineer
Messrs. Mann, Egerton and Company,
d., Prince of Wales Road, Norwich.
The hood is composed of sheet metal, designed that when out of use it discompletely out of view. The windreen is made up and fitted exactly on e same principle as the roll-top desk,

the laths being glued to the fabric, and let into the roll is a sheet of celluloid secured to the inside beading with threeply material, which is screwed on to the laths. As soon as the bood has attained a forward position, it is easy for the

passenger to draw down the screen and be completely protected from the elements, and when erected it is capable of being locked in position by means of a locking device.

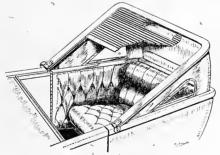

The apron runs across this body in grooves and is composed of soft

material which will not sag to any appreciable extent. It is designed on the spring roller-blind principle, and when pulled ont to its fullest extent the rail on the end of the apron engages with the corresponding rail on the windscreen. When the apron is released it automatically rolls back.

Celluloid Side Windows for Hood.

The seat is of the bucket variety, suitably upholstered, and surrounded at the top by a beading, which gives a generous clearance for the hood. This idea is distinctly ingenious, and should ensure complete protection for the passenger, while it possesses the distinct advantage of folding neatly away when not in use.

It will be noted from the illustration that side windows are provided for the hood.' These are of thin celluloid let in with oval aluminium beading on each

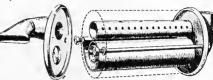

A combined hood and screen designed to fold out of sight when not in use.

A hood may now be regarded as one of the sidecar passenger's necessities, but it is to be hoped that, in their search for luxury, manufacturers do not overdevelop the sidecar to such a degree that the price becomes prohibitive and the weight excessive.

GRADUAL EXPANSION OF EXHAUST GASES.

T is very satisfactory to note that the question of silence is receiving the attention of both makers of motor cycles and those who specialise in fit-ments for them. There are two distinct sources of noise in motor cycles, i.e., mechanical and exhaust. The former is a problem for engine manufacturers to solve, but the latter may be attacked by almost anyone having the necessary knowledge and facilities. Messrs, Robin son and McNeill, of Napier Road.

The Robinson and McNeill silencer.

Wolverhampton, evidently have both, for they have produced a silencer for existing machines which should be highly efficient both in reducing the exhaust note and in preventing back pressure. Instead of a sudden expansion of exhaust gases into an empty chamber, as in the majority of box or barrel silencers, with the Robinson and McNeill device the gasenter the centre of a spiral, and thence pass through a slot the full length of the silencer into a gradually increasing area of the spiral itself, finally passing into the atmosphere via a long perforated tube

At a later date we hope to test one of these silencers, when our impressions will be duly recorded.

PROTECTION FOR THE HANDS.

LTHOUGH fine weather is ahead, A there still remains the possibility of sufficient cold weather to induce the all-weather motor cyclist to invest in a pair of handle-bar muffs. Cameta muffs illustrated are made of a waterproof material, lined with extra thick felt, and in consequence they will find a place on many handle-bars through-. out the year, for there are few things so unpleasant as driving in rainy weather without adequate protection for the hands. They are made sufficiently large to accommodate present-day levers, and the design is such that they will retain their shape without aid of supports. The method of fastening and attaching per-mits of them being opened out over all levers, and to be fitted in the minimum of time.

The price is 12s. 6d., from agents or the manufacturers, the from

Handle-bar muffs made by the Cameta Rubber Co.

HONOUR TO WHOM HONOUR'

Sir,-I should be greatly obliged if you could find space in your paper to publish the following example of the kind and considerate treatment recently shown me, which is not too often found, I fear, nowadays. The other day I was returning from Edinburgh to Glasgow on my 7 h.p. American The other day I was Excelsior when I had the misfortune to shear the key holding my clutch on. I took the machine into Kyle Brothers, of Coatbridge, and, notwithstanding the fact that the next day was Christmas Day, they immediately set to work and took down my clutch. A new key was made, hardened, and fitted, and the clutch entirely cleaned. The machine was also cleaned and generally gone over, and the controls were readjusted. The charge made was only 7s. 6d., and the treatment I received was most courteous.

It is indeed a pleasure to be able to find someone who will go out of his way to tackle a job at once.

Usual disclaimer. ALAN L. B. DOUGLAS.

T.T RACES AND THE I.O.M.

Sir,-Your correspondent, "R.M.," who complains of motorists having to register themselves and their cars within twenty-four hours of landing in the Isle of Man commits the pardonable error of assuming that the Island is a part of the United Kingdom.

The R.A.C. is perfectly aware of the reason for the regulation. It is because the Isle of Man is not in the United Kingdom that the Club runs the T.T. races here, the necessary

legislation being easily and cheaply accomplished.

Let us suppose the vexatious regulation were abolished—
the new order of things would, of course, cut both ways—
then Manx (and pseudo-Manx) car owners could romp about Great Britain without purchasing a British licence or paying the Inland Revenue tax. If such a state of affairs obtained. very few cars would be registered in the United Kingdom! It might mollify "R.M." to learn that when he comes to

the Isle of Man he will not need to show a rear light on his HOME RULE. motor cycle.

Douglas, I.O.M.

SPEED ON THE ROAD AND PILLION RIDING.

Sir,-May I encroach on your valuable space and make a few remarks on the above much contested questions?

I have seen many articles in The Motor Cycle (of which

I am an ardent reader) on speed, and many readers aver that it is impossible to do more than 60 m.p.h. on the road, and that one gets a speedman's "wobble." I very strongly disagree, and the only thing I can suggest is that the owner does not know how to drive. I maintain that it is possible to do any speed up to 70 m.p.h. on the road, provided that the surface is good and straight.

As regards wobble, I find that if the hands are rested lightly on the handle-bars, instead of gripping them tightly, the speedman's wobble will not occur. It also depends largely on the type of handle-bar fitted to the machine. I certainly agree that it is impossible to do high speeds with touring handle-bars, as there is not enough weight on the front wheel. I have done 65 and over many times on the road on different machines, and shall always maintain that it is both possible and safe, provided the driver is experi-

As regards pillion riding, in my opinion there should be a law passed to the effect that no rider should be allowed to take a passenger on the carrier unless he has had over six months' experience. I will go even further, and say that no one should be allowed on the open road until he

has passed a test in driving. It is not the driver who drives fast and has had experience on the road who is a danger tast and has had experience on the road who is a total to the public, but the new owner, who thinks that everyone else should get out of his way. To be really safe on the road one should imagine that everyone else is a fool, and E. B. BALL. does not know how to drive.

THE PATENT LAWS.

Sir,-It will be of interest to your readers to know that the Patent Act of 1919 contains material alterations in the practice of procedure of protecting inventions by letters

The most important of these are;

(1.) The period within which a complete specification can be lodged on an application filed with a provisional specifica-

tion is extended from six to nine months.

(2.) A patentee can have his patent so marked as to indicate that he is prepared to grant licences under it.

(3.) The investigation as to novelty is extended to publication in any document published in the United Kingdom.

(4.) The term of a patent is extended from fourteen to sixteen years.

(5.) Any patentee who can show that he has suffered loss or damage in the matter of a patent, owing to a state of war, may be granted an extension of the term of said patent.

(6.) No one other than a registered patent agent may describe himself as a patent agent, i.e., one who for gain carries on the business of applying for or obtaining patents in this country or elsewhere.

PHILLIPSS.

SIDECAR COUPÉS.

Sir,-Your interesting article in The Motor Cycle of January 8th describing and illustrating a coupé sidecar ends with these words: "We think a little experimenting will prove that a draughtless sidecar can be produced without resorting to a coupé body."

May I take this opportunity of informing your readers that this has been done, and that all interested in weatherproof sidecars, cycle cars, and rnabouts, especially manufacturers, should communicate with me at 28, Ravenshurst Road, Harborne, Birmingham, when I shall be pleased to give them

particulars of an invention I have just protected.

The coachbuilt coupé body is not the solution of the draughtless sidecar problem as it has the following defects: (1.) It is a horrible affair to be saddled with during the beautiful runs in the summer months.

(2.) It is impossible, without making the body unsightly and the wind resistance serious, to make a door hig enough for a fully grown person to enter with comfort.

(3.) It is on the heavy side.

(3.) It is on the nearly suc.

The weatherproof draught-light "top" I have invented does not depend upon a door for entry, and, in fact, the passenger enters in exactly the same manner as with an ordinary open hody. It has the following advantages:

(a) It is considerably lighter than the coupé illustrated,

and cheaper to manufacture, as in its simplest form it is made with ordinary hood canvas.

(b) It has the same graceful outline of Mr. Atkinson's coupé.

(c) It is instantly detachable at any time for a fine weather run, leaving the sidecar in the ordinary open condition.

(d) It is applicable to existing sidecar bodies without alterations and also to cycle cars such as the G.N., runabouts, such as the Morgan, and I have designed a special engine such as the Morgan, and I have cooling model for use with the monocars.

W. H. BURLEIGH.

OURING is the most fascinating phase of motor cycling. For its full enjoyment agreeable hotel accommodation is essential. Wherever A.C.U. members tour they are sure to find this in the specially appointed A.C.U. HOTELS. These are regularly inspected by the Union's Consuls and Headquarters Staff, and in visiting them the A.C.U. member may always be sure of efficient service, courteous

COMPETITIONS IN THE SOUTH.

Sir,-Having been a regular reader of your valuable paper for over five years (four of which have been spent in the Army), I have often read different readers' comments on various trials and sporting events that have taken place in several parts of England, but how many have taken place in the South or South-East? Aone, or very few. What I want to know is, why these parts of the country are neglected so much? Of course, there are not so many test hills, but, surely, there are some interesting places, such as Canterbury Cathedral, and several historic sights near; then there are various interesting places on the coast, such as Reculver Towers, Richborough, Dover Castle, Romney, and many places in Sussex So why not hold some events this summer in this part of the country?

There is no lack of hotel and garage accommodation in places like Canterbury, Margate, Ramsgate, Dover, and Folkestone. These events all help to encourage the motor Folkestone.

cycle movement and the trade.

I might mention that I was with the R.A.S. and M.T. at Peshawar, N.W.F. India, for 3½ years, and was always very glad to receive the "Blue 'Un' every week, as also were the other boys in my company, D. ARTER.

MOTOR SCOOTERS.

Sir,—May I be permitted to answer your lady reader, J. C. Patrick, regarding the "Shopping Scooter"? From personal experiences, I have found the ordinary lady's handle-bar basket as used on pedal cycles to hold a good

deal, but I am having a light box made to fit in under the saddle in the case of exceptional "loads," similar to the boxes fitted to the the Skootamotas at Cycle Motor. recent Show, the machines, I believe, being made for Messrs. Harrods. It must be remembered that everything added lo these little machines puts the weight up, which means spoiling their utility and handiness. Above 65 lb. in weight, the machine becomes a little clumsy for getting down the passage and a few steps at home.

Regarding the "holding on" of machine, can

this lady reader get a ageut (or, if I may be so bold as to ask if she lives in this part of the country, she can try my little machine with pleasure)? She will then see for herself that with properly designednount nothing is so imple. Certainly riding

over bricks or fields is different. My sole complaint so far s that there is too much nickel-plating; it looks pretty, out no one likes keeping it clean, so why not stove enamel he lot? HAROLD SOLOMON.

Bristol.

Sir, -As a very old motor cyclist, and latterly owner of scooter, I would like to give vent to my views on the setulness of these machines, and also as regards other joints. I agree with "Stanoop" that the price now generilly asked is too much, and that a good, sound practical scooter should be built for £50 to £35. As far as I can father, there is only one (the Autoglider) on the market hat is capable of climbing a really steep hill, and that one weighty machine, but sells at a more reasonable price 240) than some of the other puny devices. I have owned a scooter of foreign make, which is now being advertised in his country, sold at a price in excess of the above, which

Trying the real thing. A young scooter enthusiast interested in a "Skootamota." (See letter by Harold Solomon.)

has some quite good features, but I fear that they are doomed to cause considerable trouble and disappointment. They weigh well over 100 lb., have only one brake, rigid frame, and a most ungetatable engine, with automatic inlet, and that abomination, a drip vaporiser, in lieu of carburetter. My machine was absolutely incapable of climbing anything which could be called a hill, being only able to negotiate a very slight incline, say, about 1 in 18 or 20, at most. It could travel about thirty miles an hour on the level. The gear was undoubtedly much too high, the mixture was inconstant, and the exhaust valve in a sheltered position, so that the four-stroke engine knocked on the slightest gradient. These defects cannot be remedied without structural alterations. No; my idea of a successful scooter would be a machine having a valveless two-stroke engine of about 60 mm. × 65 mm. bore and stroke, cork clutch, 16m × 23m. tyres, disc wheels, two brakes, one on each wheel, footboard resting on thick rubber pads or else sprung, petroil lubrication (for simplicity), tank to hold about half or three-quarter gallon fuel, and with a steering column to fold down. For very hilly country, an engine having a bore and stroke of about 65 × 70 mm. should be large enough. Weight about 80 lb. at outside. Seat at option, but I would not use a seat myself, as I think that with spring footboards the standing position better, and certainly the steering is under better control.

If such a machine were geared to a limit speed of twenty-five miles an hour, I believe it would be a machine capable of anything a real scooter could be expected to do; it would be light enough for ladies' use, and a boon to many others. Such a machine could be sold at £35 to £40, even at the present time; indeed, with the smaller engine it should be possible to sell at £30 to £35, or even less—£50 seems a wicked price for a machine with tiny engine and unsprung SCOOTERIST. frame

Redhill.

SHAFT DRIVE.

Sir,-As a rider of an F.N., I am extremely interested in the recent correspondence about shaft drive. Mr. Burn and Mr. Smith use the word ideal, it would appear that this method of transmission is very much appreciated by those fortunate few who are the users thereof. I would not for a moment dream of going back to the primitive or belt system. The best belt slips at times, and even a chain stretches. Add to this the total absence of jerky take up, and the soothing hum when going at a decent speed. Only a user of shaft drive knows what this hum is like. In speaking of economy, well, I do not think the F.N. or other shaft-driven machines, if there are any, ever call for renewals. My 1913 'bus has bevel gears that are perfect, and the machine has done an average amateur's mileage. In reply to Mr. A. A. Smith, I would like to say that wear can be taken up, as there is an adjustable cone between the gear box and bevel cogs. The only sign of tear I find on the low side of the gear pi-ion. The shaft drive is "ideal." THOMAS A. WEDGWOOD.

A WINTER RUN.

Sir-I have had many delightful runs from South Lincolnshire and Leicestershire to Scarborough, but none pleasanter than the journey quite recently.

Departing from Melton Mowbray at 10.10 a.m. in a 1920 Indian Powerplus combination, we took the Nottingham Road for ten miles until we came to the Fosse Way, which took us right into Newark, one of the finest bits of road in the

Kingdom, I should say.

We did the first seventy miles of the journey in two hours. From Doncaster we took the Tadcaster Road, as in pre-war days it was always superior to the slightly shorter one by Selby, but at present it is bad from Wentbridge to a few miles east of Tadcaster. Once over that, a splendid run again on to Scarborough by four o'clock. Barring a little snow and a hailstorm at the outset we had fine weather and the sun on our backs all the way after Newark.

Having another fifteen miles to do over a moorland road, finishing with a descent of 1 in 4-an excellent brake testwe hurried on and completed the practically non-stop journey we intrited on an compress the practically hourself pounts, fresh and with the machine in perfect order, which only impresses upon one more firmly than ever that Indians are the acme of comfort and reliability. The machine was obtained from the Coventry Motor Mart, and I cannot speak too highly of their chief demonstrator's driving.
(Mrs.) S. TURNER.

MOTOR CYCLE TRANSMISSIONS.

Sir,-Your correspondent "All Belt," writing in the issue of October 30th, appears to miss two very important points in favour of the single belt type of transmission—the much greater belt economy afforded by this type, and the fact that, should a breakage occur no part of the transmission can foul

any other part and cause an accident.

While I quite agree with your correspondent as to the numerous advantages of the plain belt drive, there seem to

be two matters open to question.

(1.) Why is the spare belt of a T.T. machine easier to carry than that of the chain-cum-belt transmission of the usual type? Being a longer belt, it should be, if anything, more difficult to carry.

(2.) It would require a shaft on either side of the back

wheel to make it at all symmetrical.

Can "All Belt" tell me of any motor cycle having a symmetrical transmission, except perhaps one of the rare . birds with twin belt drive?

His own pet drive-single belt-drives only on one side of the wheel, and therefore is not symmetrical.

PISTON PACKING.

Sir,-On page 759 of The Motor Cycle for December 11th. 1919, there was shown a piston packing, a substitute for conventional rings, as devised by Mr. F. Shutler.

It may interest your correspondent and other readers to know that similar piston packing is already in use, and has been for years, on Tyneside shipyards, in oil pumps, and also in Diesel engines. It is only with the latter that I wish

to deal.

It is a fact that much trouble was (and is) experienced with the wear on cylinders of these engines, caused by great pressure behind the rings. So great was this pressure that it caused steel cylinder "liners" to be renewed after each voyage (about 2,000 miles). This wear was practically each voyage (about 2,000 mines). In swear was practically eliminated by the use of piston packing, on the same principle as that submitted to you by Mr. Shutler, the construction being different, as may be seen by my sketch

Three rings were used—A, B, and C. A was a dead fit to the piston; C was a dead fit to the cylinder (neither contracting nor expanding); B was an expanding ring press-ing C against the cylinder wall. The rings were all pegged together in an ingeni-

.See letter "Top Heavy."

multiple to prevent explosive pressure from getting behind the "compression" ring is thoroughly protected.

Wherein this device interests me is that I am unfortunate enough to be restricted to second-hand motor cycles, nearly all of which are sadly innocent of compression when they reach my hands. It would be a good thing if rings of this principle could be fitted to our mounts.

If three rings were too small or complicated, why not one "compression" ring with an L ring to keep pressure from the "inside" of it, as sketch? The downstroke of the L to be dead fit to piston, and may be made of sheet brass or copper (if practicable). Of course, pistons would require detachable heads. TOP HEAVY.

UNBUSINESSLIKE METHODS.

Sir,-I have noticed during the past year a large number of complaints published in your paper against British motor cycle firms on account of their mbusinesslike and discourteous treatment of customers. I do not think they at all realise the danger they are running in annoying and inconveniencing their customers in this very unnecessary

Just before Christmas I bought a new 3½ h.p. bicycle, fitted with low gears, for a sidecar, and as I wished to ride it solo I wrote to the firm asking if they would exchange the engine sprocket for a larger one. I received a reply in about a week, and on January 2nd sent off the sprocket and also a letter containing a postal order for some extra chain links. I received no acknowledgment, and having heard nothing from them by January 7th, I wrote again. On January 10th I received a reply, with no hint of apology, saying that they had the matter in hand, and would forward the goods on receipt of a further remittance, as the first did not cover. (This, in spite of the fact that I had obtained the prices from their own price list, sent only a fortnight before, and had added 75% according to their directions.

I only hope I shall not experience any trouble with the machine, as in that case it looks as if it will be in dock most

of the time.

This kind of treatment will inevitably bring its own reward as soon as production becomes normal again, and may do considerable injury to British trade. W. W. THOMAS.

THE A.C.U. REPORT.

Sir,—This report, together with the subsequent correspondence published in The Motor Cycle, is most interesting. In the first place, I was rather surprised that Mr. Norton should attack this report. I consider that the Notion should attack this report. I consider that the A.C.U. report is quite justified, and admire the outspoken criticism of motor cycle engines. That air-cooled engines are not ideal for these trials is quite evident to anyone who was there to observe. The average person, however, observes in the wrong place. He stations himself on the steepest part of the steepest hill, and, if the machine climbs this successfully, he knows it to be "some bus." If he went to the top of the hill and saw the clutch slipping and tap twiddling of the driver in the process of "changing up," he would be set thinking. Konking is by no means rare, and sluggishness, caused by an over-heated engine, very common.

I had hoped that manufacturers would benefit by their war-time experience on aero engines. But, as regards cooling, I think that it has influenced them in the wrong

direction—toward air-cooling is, as on motor cycles, only-fairly satisfactory. All large, long distance machines, in which the engine must keep its tune, are water-cooled.

The disadvantage of air-cooling on motor cycles is much more evident than on aero engines. There are no long hills to be taken on low gear by aero engines, and the speed attained by the machine always causes guite a resence table attained by the machine always causes guite a resence table. attained by the machine always causes quite a respectable cooling draught. Most motor cycles rely as much on oilcooling as on air-cooling, and after about two miles of 1 in 4 the riders have to drain some oil out of their crank cases, when they get to the top of the hill, if they do not want sooted plugs. I have seen this happen in many big trials.

Motor car drivers have not all this fuss, and, of course, the Scott, although it has a small oil sump, is not fitted with any means of draining out the oil. I have a

Scott combination, and it is a no-trouble machine. It is quite impossible to overwork the engine.

I consider the engine of the future is the two-stroke, but the advance in design of this type of engine is almost at a standstill, manufacturers being content to copy a few of the most successful makes. In its present form the two-stroke wastes more petrol than it uses. This drawback can be overcome easily. I wonder it was not done years ago.

I should like to see your paper open a competition for designing the best all-round engine. Most riders take a great interest in their engines, and nearly all have some little gadgets of their own for improving the running and power.

There is no knowing what such a competition would bring out. Perhaps, a petrol-driven turbine. . W. ROWLAND BROOKING:

"THE MOTOR CYCLE" ROAD MAPS.

England and Wales, Scotland, London (showing roads into and out of London and avoiding London).

Mounted on linen. Set of three, complete in case

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls. 000000000000000

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Using Benzole.

(1.) When using benzole on a motor cycle, and more air is required than it is possible to give without altering the carburetter, is it more satisfactory to reduce the size of the jet or to attach an additional air inlet? (2.) If the former is the better plan, does it reduce the power of the machine?—J.M.B.

l.) It is better to reduce the size of the it. (2.) No, it increases it by improving se mixture.

Fixing an Exhaust Lifter Cable.

Will you kindly let me have instructions for fitting a Bowden exhaust lifter cable to a 2³/₄ h.p. Douglas?—W.L.

o particular skill is required to fit a sw exhaust lifter cable to a motor cycle. Il you have to do is to measure off the ble to the exact size, then you have to deer on the nipples. Before cutting, the ire should be tinned, as unless this is one the wire will fray badly and become omanageable. Having tinned the wire, ip the nipple in position, leaving about rin, of cable projecting, put a fairly reg lump of solder on the end of the ble, and let it run down well between unipple and the wire. When cold, arr the projecting end of the wire over, his is the only difficulty in fitting the blet, and let hough, of course, it must be proarly adjusted afterwards.

A Sticking Valve.

I have a 1914 6 h.p. Royal Enfield fitted with two-speed gear and sidecar. After a long run the front exhaust valve burntout. After renewing this, I found that on the road it would only fire on the back cylinder. The valves are properly adjusted. If I take off the back plug-it will fire on the front cylinder quite well, and if the front cylinder quite well, and if the front lug is taken out it will fire on the back one, but if the two are in position the engine will only start on two for about half a minute, and then the front cylinder gives up the ghost with a series of flashcs on the exhaust box, but the back cylinder, continues firing properly. I should be greatly obliged if you would give me some information on this matter.—I.W.

matter.—J.W.
he trouble is probably not due to the
lugs at all. Are you sure that the new
alve is not sticking and that it is seating
operly? It is possible that the stem
if the new valve is too tight and jams in
the guide as it warms up.

Side Play.

Will you be good enough to let me know if there should be any side play in the crankshaft of a Levis two-stroke, as my motor cycle has an appreciable movement from side to side, but no up and down motion in the crank case? If this is detrimental to the running of the engine? Please tell me if two very thin washers put between the inside of the crank case and the inner end of the shaft would be efficacious?—C.E.S.

Such a small amount of side play can be ignored; this is in no way detrimental to the running of the engine. There is no need to fit thin washers to prevent it.

Two-stroke Lubrication.

(1.) Will you tell me the setting of regulating screw for oil drip, average running, 23 "OK-Union"? (2.) Effect of longer reach plugs. If an advantage, or otherwise, in two-strokes?—G.B.P.

(1.) You can only find the setting for the oil drip feed by experiment; it entirely depends upon the normal speed and the nature of the oil used. It is usual to open the regulator until the engine permanently sinokes, and the setting can then be easily found by closing down the supply until the smoking ceases. (2.) Long reach plugs are not usually satisfactory on two-stroke engines.

Belt Rim Diameter.

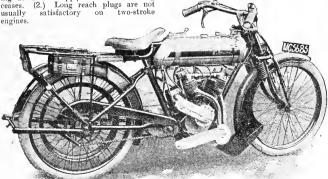

Will you please tell me what siz belt rim I shall require to give a 6 to 1 gear for a 3½ h.p. cycle car? I do not want to be under 6 to 1. I have 14 teeth on engine sprocket and 36 on gear box. The countershaft belt pulley is 7in. diameter.—J.C.

The diameter of the belt rim you require is 16; in.

Single Gear Riding.

I am thinking of purchasing a 23 h.p. single-speed two-stroke, and before doing so I should be glad to know if you think this a reliable machine. (1.) With ordinary handling, can I get up the hills usually met with on the roads in Ulster? I do not mean hills such as are traversed in the reliability trials, but such fairly stiff hills as are ordinarily met with on main roads. (2.) In case of failure on hills, can an adjustable pulley be fitted with good results?—T.F.O.G.

(1.) You will find that a 23 h.p. twostroke single-speed motor cycle quite capable of ordinary touring, and it should climb most main road hills in your district without difficulty. (2.) An adjustable pulley cannot be fitted easily to an engine with outside flywheel.

An Edmund motor cycle fitted with an M.A.C. engine, specially built from frame parts supplied in the rough by Messrs. Chas. Edmund and Co. Mr. Moran, who built the machine, was formerly with M.A.C. Engines, Ltd., and has been three years in charge of an R.A.F. workshop in France. He is now with Regent Motor Cycles, Ltd.

Electric Lighting.

(1.) I have a 4 volt 60 a.h. accumulator. What bulbs must I use for head light, tail and sidecar lights, to get best results-from above accumulator; series or parallel? (2.) Snitable size wire; would 7 mm. ignition rubber covered do? (3.) Approximate hours (all three lamps) from one charging, under normal road conditions?—C.E.T.

(1.) A 4 volt 2 amp, bulb in the head lamp and 4 volt 4 amp. in the side and tail lamps (all the lamps being in parallel) will be the most suitable. (2.) The wire known as Workshop Flex is most satisfied. factory for motor cycle lighting equipment. (3.) About twelve hours.

Firing on One Cylinder.

My 23 h.p. Douglas is in every way satisfactory, except that when I slow down to turn corners only one cylinder will fire, which means I have to drop into low gear to pick up speed. I have even found this happen on the straight when not going fast, but so soon as I open the throttle and ac-celerator, the two will get to work. Is this as it should be, and, if not, will you please advise me as to what, in your opinion, is wrong? (2.) Is a bare in. enough for the tappet to lift exhaust valve?-W.J.S.

exhaust valve?—W.J.S.

(1.) Probably you have not adjusted your tappets properly. The clearance should be equal to the thickness of the blue cover of The Motor Cycle. The valve springs, also, may be weak. Another possible failure is that the sparking plug points are too close together.

(2.) The valves should lift nearly a construct of winds. quarter of an inch.

Starting Difficulties.

I recently purchased a 3½ h.p. Rudge Multi, 1916 model, which was ridden a matter of twenty miles by the seller. I can twenty mies by time seller. I can get the engine to go whilst the machine is on the stand, but immediately the back wheel touches the ground it stops. I have started the engine on the stand with clutch in, and, also, with clutch out, and, in the latter case, gradually let in the clutch before pushing the machine off the stand. In addition, I have accelerated the engine, as advised by the Rudge people, before letting in the clutch-in my case, before pushing the machine off the stand. I have checked the timing, examined the plug and magneto, have tested the compression and carburetter, and the belt seems to have the right tension, yet, although it will start on the stand, directly it is pushed forward and the back wheel touches the ground it stops, not inimediately, but after about half-a-dozen vards.-F.K.

You are apparently itempting to start your machine incorrectly. You should not push it off the stand with the engine running, when the clutch is engaged. The correct procedure is as follows: Start the engine, fully lower the gear, disengage the clutch, and apply the foot brake in order to stop the wheel: now push the machine forward off the stand, then, having taken your seat, accelerate

MOTOR (FIGLE the clutch lever. If this is done on level ground, the machine should glide away without any effort. You will get full information on starting and all other points connected with the Rudge from the booklet issued by the makers.

Lubrication.

I have a 1920 23 h.p. New Imperial-Jap, fitted with clutch and kick starter. (1.) How often is a pumpful of oil re-quired? (2.) How is the gear changed-is it necessary to declutch? When I have started the engine and try to put the gear from nentral into low (with clutch out), the teeth seem to grate and the engine stops. What is the cause of this?—H.R.C.

(1.) Half a pumpful every five miles. (2.) You might either declutch and throttle down, or raise the exhaust lifter. (3.) Probably the gear operating mechanism requires adjustment owing to the gear box position having been altered to adjust the chain.

Overheating.

A few months ago I purchased a 1914 34 h.p. three-speed Rover, which appears to be in a fairly good condition, for with a pas-senger on a pillion seat I had no difficulty in hill climbing, generally on top gear. Recently, I have had a coach-huilt sidecar attached by a competent man. Our trouble begins at the first hill, for mnless we can take it at a rush, I have to change into second or third gear at the start, and, as the engine heats up, the machine slows down, and either stops altogether, or we reach the top of the hill at a crawling pace. I have noticed, when taking a hill at a rush, I can keep going until the throttle and air lever are opened to just over half-way; any attempt to open out more slows the machine down, but this is not the case when the passenger is on the pillion seat. Thinking to solve the difficulty, I removed the cylinder and thoroughly cleaned the piston and rings, but the result is the same. Is it necessary to lubricate the valves, as they always run dry? I might add that the top gear is 51-1, belt in., carburetter Brown and Barlow, and I run on half benzole.-W.H.

The trouble you refer to may be due to too large a jet, or to a sparking plug the points of which become incandescent and cause pre-ignition. It should not be necessary to lubricate the valve stems, and lubrication will not remain on them for long, but you night rub on a little graphite the next time you have the engine down. A lower top gear would certainly be advisable; try.6 to 1.

READERS' REPLIES. Flooding Carburetter.

Re query by "J.V." in your issue for January 15th on carburation trouble with a Big Four Norton. 1 think it quite possible that the trouble is caused by the pilot jet being in operation continually. This may come about by the sleeve which acts as a throttle for the pilot not being turned by the small lever. The lever is only held on the sleeve friction tight by a small screw. Also, it appears to me

that the pilot jet would do with a reduction in size. I found the pilot on my own 3, h.p. Norton about .025in. diameter and excessive. On reduction to .010in, diameter—by soldering over the end and reaming out with a small jeweller's broach—the engine starts more certainly and the carburation is not upset if the pilot is left in operation, though, of course, the consumption of spirit is somewhat increased.—J. C. Bennet Mitchell.

Belt Trouble.

In one of your recent issnes I , read the comment, re belt wear with variable gears; with much interest, and I should like your readers to hear my opinion. Having owned a Rudge Multi, I found the Multi gear ideal, in practically all conditions. Three years ago my wife and I went touring in the Lake District. my wife as pillion passenger. We climbed all hills, such as Kirkstone and Honister Pass, in wet weather, with absolutely rass, in wet weather, with absolute, no sign of belt slip, our one and only trouble being a sooted plug. Now, as regards belt wear. The Rudge Multi had the same belt on when I sold it as the day I first rode it, and at the time of selling it had over 6,050 miles to its credit, as registered by a Jones speedo-meter, and the belt was still in a condition to do another 1,000 miles. During the whole of my riding with the Rudge Multi I only experienced one break, due to the fastener pulling through. In conclusion, I may say that, should I ever again require a fast, sporting, reliable, trusty, single-cylinder solo mount, I shall get the good old Rudge Multi. Usnal disclaimer. - WILKIE.

Referring to 'H.W.J.'s' suggestion regarding belt wear, I should strongly advise the use of the Rapit belt end protector, marketed by H. B. Sanders, 14, Woodhonse Parade, N.12. I have just completed 3,000 miles with one of these useful little accessories fitted, and the belt ends show no signs of wear at all. Making, as they do, what practically amounts to an endless belt, I should imagine that they would be particularly suitable for machines fitted with expanding pulley gears.—D.J.C:

RESULTS

from small advertisements.

Corroborative Evidence.

The following letters confirm what has already been discovered by the majority of motor cyclists—THAT SMALL ADVERTISEMENTS IN "THE MOTOR CYCLE" INVARIABLY BRINGS THE BEST RESULTS.

The unrivalled circulation and influence of the paper explain the reason.

124 Applications

"I have much pleasure in offering you my sincere thanks for the wonderful results of advertising in your medium, 'The Motor Cycle.' I advertised a 2 h.p. Minerva and Cycle Car parts, etc., and sold both articles immediately after the publication of your book.

Altogether I have had 124 applications for both the

With such fine selling powers, I think your paper is deserving of every success.

Believe me in my great appreciation for same.

G. H. WILSON

15, Ashvale Road, Tooting, London, S.W.17."

"In reply to my last Advert in your valuable journal 'The Motor Cycle' a few weeks ago, I had no less than 40 Letters, 14 Telegrams, and about 20 Callers, one coming all the way from South Wales, which speaks wonders for your Advertising Medium You are at liberty to use this as an example should you care to. You are at inderty to accept example, should you care to.

F. P. Cook

12, Lesbourne Road, Reigate."

Enquiries.....Excellent Results...

"I am sorry I omitted to reply to yours of the 12th inst. before, but I have been so busy replying to enquiries received for the motor cycle parts which I advertised in your valuable paper. Very many thanks for the return of the amount which I sent in excess and also for the excellent results obtained.

A. W. MILLER.

Farm Street, Barrow-in-Furness."

Send your next advertisement to "THE MOTOR CYCLE," 20, Tudor Street, London, E.C.4, or Coventry.

MISCELLANEOUS ADVERTISEMENTS.

ADVERTISEMENTS in these columns First 12 words 2/6, and 2d. for every additional word. Paragraphs of under 8 words are-charged double rate, i.e., 5/-. Each paragraph is charged separately. Name and address must be counted. Series discounts. conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and he addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which cach advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is laken to avoid mistakes.

NUMBERED ADDRESSES.
For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. 123 When this is desired, the sum of 6d, to defray the cost of registration and to cover postage on replies must be added to the advertisement the same of the cost of the advertisement. All replies should be feel advertisement advertisements containing a remittances should be sent by the containing the containing and the containin

cases it is accusable to make use of the Deposit System. In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being iospected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal to perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Deposit System. I have large contracts with all these famous makers, and all orders placed with me will be executed in strict rotation. Don't court disappointment by delaying YOUR order.

Increased business demands increased space, and I am at present engaged in alterations and extensions that will place my showrooms among the finest in the Kingdom,

These alterations include:—Vast new ground-floor showroom-7,800 sq. feet-where it will be possible to show my large stock to the best advantage.

Service Depot, 14-22, Severn Street, where I shall be in a position to give my clients unlimited service, and where they may be sure of the attention and courtesy upon which my business has been built up.

THANK

their numerous customers for the consideration and indulgence extended to them during the difficult period of removal from LONDON to New Offices, Warehouse, and Works at CROYDON.

Delays have unavoidably occurred during the past two weeks occupied in removal, but increased staff facilities and better working conditions will ensure the utmost promptitude and attention to all enquiries and orders, in as far as the unsettled conditions existing in the labour and raw material markets will permit.

As soon as the Works are in full swing it is hoped that Stocks will be increased to such an extent that deliveries can always be made immediately on receipt of

Many new lines are in course of production, and customers should therefore ask for their name to be added to the mailing list for new catalogues as issued.

OUR AIMS ARE

BEST QUALITY AND DESIGN. INCREASED PRODUCTION. PROMPT DELIVERIES. NO COMPLAINTS.

Will all Customers kindly note CHANGE OF ADDRESS.

Weight the Governing Factor.

ESPITE the fact that a tax on fuel is the most fair method of taxing motor cycles, it is certain that the fuel tax will be abolished and that in all probability weight will be the factor used. Such a factor would be quite fair to motor cycles, provided the owner is only required to pay an amount in direct proportion to the weight of his machine, but we fear this will not be the case, and that weight will be used only to define classes of solo motor cycles.

The proposal has been made that motor cycles be taxed in three classes: (1) lightweights up to 200 lb. £1 10s., (2) solo machines over 200 lb. £3, and (3) sidecars £4. Considering the means of the average motor cycle owner, such figures as these are surely unreasonable. Although they are proportionate to the suggested new car taxes, which it is said will be on a basis of £1 per h.p., we feel that the acceptance of such proposals would have the effect of restricting the motor cycle movement and less revenue will be forthcoming than if the tax were lower.

We know there is a feeling among many motor cyclists that any appreciable increase in taxation will force them to give up using motor cycles. It appears to have been overlooked that the motor cycle is the poor man's mount, and is owned, as a rule, by a section of the public which has suffered more than any other by the general increase in the cost of living, and includes a large number of persons who, at the present time, are living very near to the limit of their income.

A clean cut between machines of under and above 200 lb. means that the difference of a few pounds in weight may subject two machines of practically identical design to 30s. and ± 3 taxes respectively. It is true that any sharp line of demarcation generally discovers such cases; there is room, then, for a more gradual scale. In no case with car taxation has there

been a parallel—a fraction one way or the other has not before involved double taxation.

So far as concerns the motor cyclists' contribution to the amount which the Government has decided that users of mechanically-propelled vehicles shall contribute, probably the estimated total is quite proportionate, but we feel that it should be more evenly divided.

The Number of Motor Cyclists.

N March, 1919, there were 116,600 motor cycles licensed in Great Britain and Ireland as compared with 158,000 in 1916. The former figure is due to the fact that the majority of motor cyclists had not returned to civilian life at the date mentioned.

In 1916 148,800 motor cars were licensed, and it is estimated that by March this year there will be at least 200,000 private cars in this country. If an increase of over 50,000 is reasonable to expect in the case of cars, then at least 75,000 may be added to the 1916 figure to obtain the possible total of motor cycles in use. Considering the comparatively high prices of motor cycles, this figure must be considered as highly satisfactory by all interested in the future of the industry. It reveals the possibilities of a general utility type of machine produced at a low figure, which will attract those who would use it in preference to trams, trains, and pedal cycles.

Whether there will be a quarter of a million motor cyclists in this country by the end of this year depends to some extent upon the new taxation, which we hope will not restrict the development of a young and growing industry and the training of men in mechanics, which has been of such value to the nation. But for the motor cycle, thousands of men would have never attained the degree of usefulness which was revealed during the war.

It should be pointed out that the 1916 and 1919 figures quoted represent the number of machines upon which the £1 annual tax has actually been paid.

The Stanger V Two-stroke.

R. MACBIRNIE, of the Birmac Aeroplane Co., tells me that the Stanger V twin two-stroke is not a mere glass case engine, an experimental brainwave, which has never sampled the roads, as some visitors to Olympia supposed. He was down in the Cotswolds the other week, and saw it romp up Nap Hill and the Nailsworth Ladder. At the top of Nap Hill Mr. Stanger asked him to put his hand on the cylinders, and they were so cool that it was possible to keep the hand on them. Is there any four-stroke of which the same could be said? Mr. McBirnie is my twin soul on the controversial question of silencers. He considers that his Powerplus engine is "positively dangerous" with the cut-out shut, and he only employs full silence when he is alone on the earth with an interesting passenger in the sidecar. By the way, if the Stanger twin can tackle Nailsworth Ladder without stewing its sparking plug, it may be just the cheap, high-powered engine for which the £100 monocar is still searching.

Big Trade Teams in the Six Days.

URING next summer we shall witness fresh attempts to "find a winner" on the part of ingenious trials organisers. At present the A.C.U. policy on the question embodies the following items:

i. Freak surfaces.

ii. Freak hills.

iii. Freak speeds over freak going.

Examination of finishing condition.

The first three items are admittedly counsels of despair, which permit good machines to be penalised by bad riders or by bad luck; they are mainly adopted because the distance would be inadequate to classify modern machines unless "stunts" were included. The fourth item is entirely sound in principle, but leads to friction, because

(a) It is difficult to justify all the penalties (a published report would occupy reams of paper; the marking of various defects stirs up criticism, and

secrecy makes for trouble).

(b) With a large entry it is impossible to one judge to overhaul all the machines. It is difficult to get a dozen reliable judges. It is difficult to obtain consistency in the markings of several judges.

To do the A.C.U. justice, they would probably have included a long sprint on Brooklands in 1919, if the track had been rideable. The track will be ready by August, 1920. If the freakish element in the route is largely reduced, and large teams of, say, six riders apiece are insisted upon, there will then be no difficulty in finding a winner, and the winners will win on merit. If the going is comparatively normal, the trade might evince no objection to each

team consisting of three professionals and three amateurs. Mr. Stanley Wells's analysis of the last Six Days proves how vital the size of a team is to an accurate estimate of comparative merit.

An Afternative Suggestion.

CORRESPONDENT has sent me quite a different suggestion of distinct though revolutionary interest. He considers that the familiar type of Six Days is as unnecessary as it is unsatisfactory. It fails to provide accurate tests of stamina and tune maintenance. It is no longer required for "exhibition" purposes, since the numerous local agencies enable the public all over Great Britain to inspect the various makes of machine, and loca owners provide opportunities for seeing them on the road. He considers that a comparative test of the efficiency and durability of the various makes is wha the A.C.U. ought now to furnish, and that this could be best provided in the form of a really prolonged trial on Brooklands. Entries to be limited to the trade, each concern to enter a single machine, with two, three, or four riders. The bulk of the trial to consist of high-speed reliability, say, 40 m.p.h. o more, with a change of rider every hour. Every stop except tyres, to count. Fuel and oil consumption to be recorded.

I dare say we shall eventually arrive at something of the kind. The natural tendency is for trials to become more and more technical, and the ideal is a long distance high-speed test of the reliability of the machine on the track, balanced by a prolonged test of the engine on the bench. But I fancy my correspondent has been born a few years too soon.

Pistons, Bearings, and Oil.

66 T BIQUE," who has forgotten more than I eve knew, lets me down lightly for daring to differ from him. Of course, this encourage me to persist. I crave further enlightenment. ventured to assert that ball and roller bearings reduce an engine's thirst for lubricant. He retorts that piston design is the determining factor in oil economy Without thought of controversy I want to put the following experiences to him in my own fat-header way. I have often seized a motor cycle piston, bu never for want of oil-always because it was originally fitted too tightly, or because faulty cooling produce distortion and piston friction. On the other hand I have more than once seized up big end bushe without seizing up the piston. I gathered (being a uninstructed person, dependent on my own brainwaves that when a plain bearing engine is working sweetly you have to allow a little more oil than the pistor requires in order to prevent your big ends from heatin up in a prolonged blind. I was confirmed in this apparently wrong opinion by the fact that, when

Occasional Comments.-

get hold of an engine which has no plain bearings in the crank case, I can usually run it on a quarter, a third, or a half of the oil which more conventional engines demand. Will "Ubique" please deal gently and lucidly with my perplexities?

D.R. Testers.

AM sorry "D.R.M.M." chose to take my jesting remarks so seriously. We all know that D.R. machines had to start easily. As a matter of fact, my 1919 machines received no road test at all, partly because we were all hotstuffing the factories for delivery and perfectly willing to do the testing ourselves, partly because it was unsafe to keep a complete machine at the factory for an hour after it had left the erecting shops-somebody with a pull was sure to come along and annex it, so that timid manufacturers despatched completed 'buses as fast as they were assembled. The details of tune in the frightful scurry which accompanied the resumption of production last year were thus largely a matter of luck; and it says much for the trade that delivery tune was not worse. Things are getting more normal nowindeed, might have been already normal but for the moulders' troubles

American Magnetos.

SUPPOSE every manufacturing country turns out good and bad samples of the various commodities which it produces. But-to put it as kindly as my natural politeness allows-the average quality of American magnetos exported at present does not reach

breaker lever had to oscillate 9,000 times in each These requisites-at the aviation level of reliability—are sufficient proof of quality. organisation may have allowed a few dud magnetos to leak out of some British factories, but there are American patterns of which the majority do not seem to be worthy of trust. One correspondent took a pair of these instruments to be remagnetised the other day and tested them before leaving the repair shop and again on arrival at his home half an hour later; they had already weakened appreciably—a fact which suggests that the magnets themselves were made of a quite unsuitable steel.

Sideslip.

57 AVE other riders noticed how the terrors of sideslip have diminished of late years? I grow no younger, and nerve, which is a vital element in tackling dangerous surfaces, cannot be better than it used to be. I find that nothing really frightens me nowadays except deep, mud-clogged ruts. Years ago I did not dream of entering in a Six Days without fitting very special covers. To-day I ride faster and over worse roads without thinking of a tumble. There are several elements in this added security. Machines are well balanced with good steering. They are not so top-heavy as they used to be. The drive is smoother. Variable gears destroy the old urgency for taking uphill corners rather fast. Not long ago I tested a somewhat prehistoric machine on a bit of grease, and the old sensations flowed back into me instantaneously. I at once felt as if I were perched up on a dizzy

eminence, skating over a surface which was threatening to slide away from beneath me. By comparison, the modern machine sits down firmly on the road, and gives the impression that its wheels are biting remorselessly through the surface grease into the hard substratum.

SCENES AT THE RECENT THIRTY-SIX HOURS WINTER TRIAL IN HOLLAND.

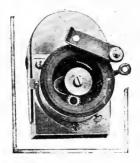

The result of this trial was given on page 125 in last week's issue.

A THREE-CYLINDER RADIAL ENGINE.

The 309 c.c. Redrup Power Unit with Aluminium Pistons, Enclosed Valves, and Mechanical Lubrication.

ENQUIRY into the possibilities of radial enzines for motor cycle work has long been urged by this journal, notably in an article reviewing past efforts in this direction, which appeared in the issue of February 7th, 1918; and it is therefore a matter of considerable interest that we are able to give the first description of what is no doubt the earliest commercial example of this type.

Three-cylinder high-tension distributer fitted to the Runbaken magneto.

The engine in question is the product of Messrs. Boyle and Redrup, of Burmantoits. Leeds, and is designed by Mr. C. B. Redrup. Additional interest is attached to the subject by the fact that

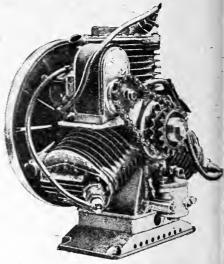

it is being produced in a centre noted for heavy engineering work that has notoriously eschewed the light internal combustion engine, and it becomes significant, therefore, that a power unit radically departing from conventional motor cycle practice should emanate from the home of leviathan locomotives. There are indeed signs that the engineering North is waking up to the possibilities of the lighter forms of transport.

No Exposed Working Parts.

First impressions of the Redrup engine are apt to be deceptive, since there are no visible working parts other than

the flywheel and chain sprocket. Such a complete hiding of mechanism at once leads the observer to expect complication and difficulty in dismantling, but after duly examining the exterior construction it came as a surprise to see the designer dismantle the engine in a few minutes, and, later, reassemble it almost as quickly.

The engine is built within a cylindrical cast iron shell, from which radiate the three cylinder barrels, spaced at 120° intervals. Extremely wide cooling flanges are used, which make the cylinders appear much larger than one

A general view of the 309 c.c. Three-cylinder Redrup radial engine. All working parts are enclosed.

would be led to expect when the 50.8 mm, bore and stroke are remembered. Parallel with and on each side of the cylinder bore are smaller cylinderical holes bored down into the crank chamber. These holes are chamfered at the top to form the valve seats.

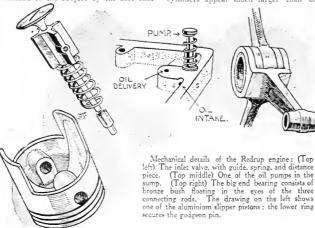

The cylinder heads are of aluminium, and secured by a number of small screws close together, thus avoiding distortion in bolting down. The only opening in the head is the plug aperture.

Symmetrical Crank Assembly.

A single-throw built-up crankshaft is employed, and the two parts are rigidly secured together by a taper on the crank pin, which is further prevented from movement by a bolt passing through the piu. Four dowel pins are pressed through the bolt head into holes drilled half in the pin and half in the crank web. The balance weights are heavy gunnetal castings secured to the crank checks by a projection which passes through a hole and is there riveted over.

The connecting rods are beautifully made in uickel steel; one has a single eye, and the others are forked, so that the three are in the same plane. A bronze bush floats between the crank pin and the three rods. No bushes are fitted in the small ends, the gudgeon pins working directly in the rods and floating in the aluminium pistons. The latter are extremely light, being of the slipper type, and fitted with three very narrow rungs: the lower ring covers the edge of the gudgeon hole to prevent the pin from working out and scoring the cylinder wall.

A long screw thread is made inside the ends of the cylindrical crank chamber, and into each side is screwed an

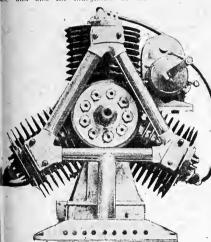

MOTOR (YCLE

Three-cylinder Radial Engine .-

luminium disc having a bronze bushing the centre, in which the main shaft otates. Next to these are placed brouze astings with flanges turned to fit the eccesed faces of the aluminium discs.

The latter have indentations at interals around their outer edges, and when disc is screwed into the case one of hese recesses is brought opposite a large ircular hole in the outside of the crank ase. The bronze casting above-mentioned pushed into place and rotated until a mall hole comes opposite the hole in the ase, and a locating stud having a small iameter stem and a large head is dropped The head fits the hole in the crank se and also the indentation in the

The deep radiating flanges of the Redrup cylinders ensure to running. The flywheel has been removed to show the cool running. exhaust pipes,

ner disc, thus locking the latter, while e stem locates the casting (which con-ins the tappet guides) in relation to e cylinders.

The Timing Gear.

Besides the locating stud, each bronze sting has three equidistant bosses illed to form tappet guides, and a urth and similar one in which works e tappet operating the oil pump. Fitted to the back of the casting are nine tas, equally spaced around a circle acentric with the sbaft, on which is yed a steel eccentric. Rotating on the centric is a form of gear wheel which peculiar in having the space between ust would be the third and fourth of ch set of four teeth left solid. The ameter of this wheel is less than the meter of the circle of studs, and conseently as it rises and falls with the volution of the eccentric. it meshes th them and rolls round, making one mplete revolution to eight of the shaft. As the broad topped "double" teeth me beneath the tappets, their rising th the movement of the eccentric lifts a valves smoothly and directly, and

in consequence of this extremely light tappets only are needed. The oil pump tappet is operated by all the cause in turn, and it therefore makes four strokes in eight revolutions of the engine. Inside the cam ring is a bronze bush bearing on the eccentric.

Covering the timing gear is another aluminium disc. This has a ring of nine holes, and when it is screwed close to the studs sleeve nuts are passed through and screwed down, so locking the disc and enclosing the whole timing gear. A long bronze bush for the main shaft is also litted into the outer disc.

The Enclosed Valves.

The valves with their springs and guides assembled are dropped into the holes at each side of the cylinder bore. A very high quality steel is employed, and the walves are practically unbreakable; they are very light in weight, and only require very weak springs. Bronze guides are used, the solid cylindrical one. while that on the inlet side is of cruciform section to permit the passage of the gas, which travels from below through the spring and past the valve head to the cylinder. The guides are secured by small set screws inserted through the cylinder casting. The valve springs are secured by turning the lower end of the wire itself diametrically across the coil and passing it through the hole in the stem. Owing to the fact that the valves work in a tubular space, the valve springs do not

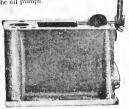

need to be secured in any other way, as they cannot work sideways sufficiently to get loose. Cup-shaped distance pieces are fitted on the ends of the valve stems, and discs can be placed in these for tappet adjustment.

within the engine itself, the carburetter being bolted to the aluminium oil sump, on which the iron shell of the engine is secured by four long bolts. Two
oil pumps, the induction pipe, and
a butterfly throttle are housed within this base chamber

partment. A very simple carburetter is fitted, and it is bolted directly on to the engine base. Top feed is employed, the float being fitted with an inverted needle.

in addition to the capacious oil com-

The sump is divided into two portions—the top contains the induction passage and throttle; the lower contains the oil pumps.

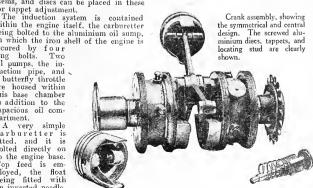

The jet projects into the induction pipe, which at this point is of venturi form. The throttle is the only control.

Gas enters the annular space between the two screwed aluminium discs on the induction side of the engine, and passes to the valves through the springs and guides as described above.

The exhaust gases pass out of the cylinders through large ports into aluminium boxes having double outlets. These are all connected so that the

These are an connected so that the three cylinders discharge their gases through a triangular pipe into the silencer. The sump is divided into two parts, and the base contains the two pumps. The latter are quite simple, being of the plunger type, depressed by tappets from the timing gear and returned by springs; ball valves control inlet and delivery. Each pump is connected by internal ducts to the timing gear on its own side, and the oil thence passes through the drilled shaft to the big ends, finally splashing on to the small ends and cylinder walls.

MOTOR YCLE

A Three-cylinder Radial Engine .--

As may be expected, a special distributer is necessary for this type of engine, and this has been very ingeniously arranged on a Runbaken single-cylinder machine.

The Distributer.

The armature runs at one and a half engine speed, and in place of the usual high-tension terminal a flanged bronze gear wheel is fitted as an extension of the shaft. Around the wheel is an in-

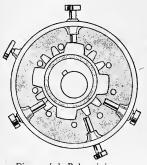

Diagram of the Redrup timing gear,

ternally-toothed fibre case, in which are three equidistant brass segments projecting outwardly to form terminals. Between the case and the wheel runs a toothed hronze roller, which makes one circuit of the internally-toothed track to three revolutions of the armature. The separations of the contact hreaker points are coincident with the passage of the roller over the brass segments; therefore the current is distributed to them at the proper intervals required hy the cycle

High Revolutions.

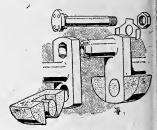

of operations.

The engine dimensions are extremely small, the total height being under 12in., while the distance over the heads of the front and rear cylinders is 9in. The light steel flywheel fan is about 10in in diameter.

The light sweet hywheet has a continuous parts, high revolutions are obtainable, and we were informed that 6,000 r.p.m. have been obtained. Actually we have seen the engine turning over at well above 4,000 revolutions, and, no doubt owing to the large cooling flanges and the draught from the flywheel vanes, no distress was noticed after considerable running in a very confined space. At this speed over 9 b.h.p. was indicated, and at 800 r.p.m. 1 b.h.p. is given. These results are indeed excellent for an engine of 509 c.c. capacity, which weighs only a little over 30 lb.

Unfortunately, the engine was not available for a road test, but we anticipate an extended trial on one in the near future, when it will be interesting to observe the behavious, under strenuous road conditions, of this genuine miniature aero power unit.

In the past such engine designs as the one under review have been the subject of speculation rather than otherwise, and it must indeed be taken as a sign of the times that the lessons gained during the war are now demonstrated by the passing of a motor cycle power unit of this type into production; it may even be the beginning of a new trend of development.

Built-up crankshaft, showing method of securing the two parts and attachment of balance weights.

An Infinitely Variable Gear.

A Positive which can be Varied Gradually from Zero upwards and also provide a Reverse,

THERE have been in the past many attempts to provide an infinitely variable gear, which should be positive in action and have a wide range. Another neat solution of this problem is offered by Messrs. Wonham and Walker, whose gear not only provides a gradually varying ratio from zero to engine speed and over, but can also be constructed to give a reverse.

Constructed to give a reverse.

The engine has a driving sprocket on one side, and over this runs the chain that provides the greater amount of the power required to drive the machine. On the other side of the engine is an expanding pulley, which, in conjunction with another similar pulley on the countershaft, controls the gear changes, and at the same time does a certain proportion of the driving. In a housing, shown black in the drawing, is carried an epicyclic gear containing two driven and one driving components. Of the two driven components, one is driven at a constant ratio, while the speed of the other is varied by the expanding pulleys just mentioned. The operating mechanism of these pulleys is so arranged that as one opens the other contracts, and the belt tension is thus kept constant. The construction of the gear is made perfectly clear by reference to the sketch, and its action is as follows:

When the speed to the two sun wheels, driven by the chain and belt respectively, is the same, then it is plain that the whole gear will revolve en bloc, and the gear at the road wheels will be that given by the sizes of the various chain

sprockets; in other words, the machine will be running on a direct speed of, say, 4 to 1. Now supposing that the total ratio of the four gear pinions be 2 to 1, if the belt pulley revolves at twice the speed of the chain sprocket, the cage containing the planet gear and carrying the driven sprocket will remain stationary, and the road wheels will not only be standing still, but will be locked, and

TO ENGINE
SPROCKET
TO ENGINE PULLEY

Wonham and Walker's variable speed gear, which will give forward speeds from zero upwards and a similar reverse.

no brake will be required to hold the machine when starting on a hill. Since an equal speed gives a direct drive and a difference of 2 to 1 gives zero, it is plain that any ratio between these will give some speed lying between zero and direct. Moreover, if the pulley speed be increased to more than the 2 to 1 ratio, a reverse will be brought into play, and again, if the pulley speed be reduced below that of the sprocket, and that of the sprocket, and that of the sprocket, and the sprocket and

speed be reduced below that of the sproaket, an indirect top speed will be obtained, which is limited only by the construction of the gear, i.e., the number of teeth in the pinions and the variation of speed permitted by the expanding pulleys.

This gear somewhat resembles that of Mr. Ingall, which was described in The Motor Oyde of January 20th, 1916, but it differs in one or two important particulars, and novelty is not claimed for the same points. It will be apparent that such a gear is highly snitable for cycle cars and passenger outfits, as it would enable a start to be made on any hill where wheel grip could be obtained.

The Cotton motor cycle.

A Lightweight with Triangulated Frame.

Showing triangulated construction of the

Cotton motor cycle frame.

A Design in which Sound Mechanical Principles are Followed.

LTHOUGH the frame illustrated on this page is not an entirely new design—we tried it ourselves in 44—it is of interest at the present ne, because it forms the leading feature a new lightweight motor cycle proceed by the Cotton Motor Co., 11, ristol Road, Gloucester. The design is first experimented with in 1913 and 44, as a consequence of the judges' itseism in the open trials concerning

nme design.
The frame is designed in accordance th acknowledged mechanical principle, ery tube being straight and subjected dy to compression or tension, bendg strains being obviated as far as pos-

an additional child's seat is manufactured by Messrs. J. Ayden and North, 4, St. Albans Place, Upper Street, London, N.1.

He'd below the seat are two arms, which, pro-

Held below the seat are two arms, which, projecting from each side, are clipped into slots screwed to the sides of the body. These arms can be adjusted laterally to fit any width of sidecar. The seat is held up by a rod pivoted on its underside, which fits into a hole drilled in a plate screwed to the floor of the sidecar. The arms of the seat of the same of the seat of the s

upholstered backrest are pivoted on rollers in the rear of the seat, and can be folded down over the latter, which enables the whole fitting to rotate on the side clips, and be placed inside the nose of the body. This useful fitting does not interfere with the comfort of the passenger, and can be fitted to any ordinary sidecar in a few minutes.

Abspine Automotive and Automotive an

The J.A.N. child's folding sidecar seat.

ble; in fact, if the seat tube was not unected to the duplex diagonal mems from the head to the rear wheel tre, a true triangulated construction ald be obtained. The aim has been produce a frame triangulated at every ut, with stress or tension at the apex ty of any set of tubes. The result is light, strong and wisid generation.

ut, with stress or tension at the eapsy ut, with stress or tension at the apex ty of any set of tubes. The result is light, strong, and rigid construction, minating the chances of breakage ough fatigue of metal to a minimum, the construction should also prevent salignment of wheels and provide

salignment of wheels and provide reacrdinary stability. Important was a specification including a liliers two-stroke engine, Albion two-lead gear box, chain-cum-belt transsion, Saxon forks, 26 × 2½ wheels, cett's pan seat saddle, the price is guineas, at which figure it will apult to a large coterie of riders who retree a light, handy machine, built on tentific principles.

THE J.A.N. FOLDING SIDECAR SEAT.

O obviate the necessity of purchasing a two-scater sidecar, the bulkiness and weight of which are inclined to the engine on lower powered outfits a greater extent than is necessary,

SPRING FOOTBOARDS.

I N our issue for December 4th, we illustrated a spring footrest, a speciality of Messrs. Rose and Co., of 365, Foleshill Road, Coventry. The accompanying illustration depicts the

The Reseden spring footboards, which are adaptable to many makes of motor cycles.

aluminium spring footboard, marketed by the same firm.

In conjunction with a well sprung saddle, especially if the latter is mounted on a spring seat-pillar, this device should give the maximum of comfort on a rigidframed machine.

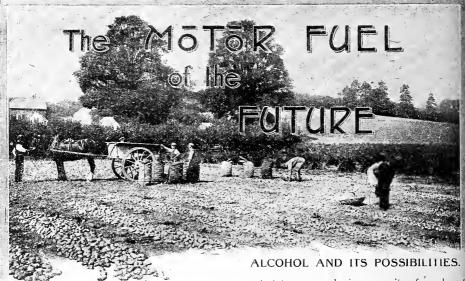

RAPIT BELT FASTENER PROTECTOR.

FREQUENT cause of trouble on belt-driven machines may be located at the vital point where the two ends of the belt are locked together by a steel fastener. As the belt rotates round both the engine pulley and belt rim a considerable amount of wear takes place. A useful and cheap accessory, which has recently been marketed by the inventor, Mr. H. B. Sanders, 14, Woodhouse Parade, London, N.12, has been made to protect the fastener on the three sides which are in contact with

The "Rapit" belt fastener protector

the rim. This device, which consists simply of a leather strip held together at the top by a screw, in addition to offering a gripping surface to the rim, renders the belt practically endless. It is made to suit all sizes of belt.

The farmer as a fuel producer. It is more than probable that more uel will in the future be obtained from potatoes and other vegetable products. Contrast this rural scene with the oil field on the next page.

The we were told that we could sow a few petrol seeds in our gardens in the spring and reap a crop of petrol in the autumn, our first impression would be that our informant was either joking or mad. Yet, although the statement would not be true of petrol, we have only to substitute the word "alcohol" to make it very near to the truth.

Ever since motoring has been possible, the problem of fuel has been a vexed one. In the early days, when surface carburetters were the only kind known, we were supplied with a spirit of low specific gravity distilled from crude American petroleum. As the demand for the spirit went up, the makers increased their output, but, in doing so, produced a different type of substance, the reason being that, in the distillation of the crude oil, the portion of the distillate boiling between certain predetermined temperatures was separated from the rest and sold as "petrol." This petrol consisted largely of the hydrocarbons hexane (C_6H_{14}) and heptane (C_7H_{16}) . It was found that, if the distillate taken were such that its boiling point were a little higher, a very much greater yield of "petrol" could be made from the same quantity of raw oil. The petrol thus made contained less hexane, and, in addition, a large quantity of a heavier hydrocarbon, octane (C_8H_{18}) .

The Specific Gravity of Petrol.

As time went on and the demand increased by leaps and bounds, the petrol distillers supplied the public with a heavier spirit, until, at the present time, instead of using a petrol of specific gravity 0.6-0.7, we are

content to use one having a gravity of nearly o.8. This heavier spirit is not necessarily inferior to the lighter products; in fact, used under the right conditions, it is better. The alteration in quality of the petrol necessitated the adoption of a new kind of carburetter, and, with the increase in specific gravity of the spirit, the efficiency of the surface carburetters decreased and the modern "spray" type became absolutely essential.

One of the greatest evils in the history of motoring is the "cornering" by the oil syndicates of practically all the large natural oil deposits in the world. This has led to the inflation of prices paid for petrol, and, as long as petrol continues to be the recognised motor fuel, so long will the motoring public suffer from this trouble.

* No Monopoly of Potatoes.

It is on account of the limitations imposed on the supply of petrol at a reasonable price that other fuels have of late years been sought after. Benzole, made from coal tar or coal gas, has, to a large extent, replaced petrol, and has the advantage that it is a home-produced product. Here, however, the same difficulty of a limited supply presents itself with all the attendant evils of monopolisation by a comparatively small body of men.

On this point alcohol scores. It has been proved that the manufacture of alcohol from potatoes and other vegetables is a commercial success. No amalgamation of firms would seriously attempt to "corner" potatoes, for the simple reason that a rival syndicate has only to plant one potato in order to produce, in a few years, as many more as it requires.

Unfortunately, however, alcohol is liable to a heavy duty in this country, and the payment of this duty makes its price very high. Steps are being taken by

he Motor Fuel of the Future .-

arious organisations to try to persuade the Government to see the folly of its ways, and it is hoped hat, in the near future, alcohol will be obtainable at price much below that of petrol.

In this connection it is interesting to note that, wing to its use as a fuel in Germany, its price in hat country fell from 3s. 9d: per gallon in 1887 to

id. per gallon in 1904.

Our Continental neighbours, notably France and Jermany, and later, Russia, have successfully used leohol as a fuel for many years past, and the problem we have to face is not so much that of its use as of its production.

The Brewery of To-morrow?

The manufacture of alcohol from potatoes and other egetables which can be grown in huge quantities rithin the precincts of the British Empire, depends rimarily upon the same chemical processes as a resed in the brewing of beer, etc., viz., that any subtances which contain starch or sugar can, by a suitable process of fermentation, be caused to yield leohol.

Other processes, such as the manufacture of alcohol rom coal gas, acetylene, etc., are likely to be cometiors of the fermentation process during its early ays, but these processes have the disadvantage that hey are capable of being "cornered" by minewners and that they depend on the presence of fixed eposits in the country, whereas the production of egetable alcohol practically amounts to harfessing he sun's rays, and can be carried out in almost any ountry.

In order to comply with Government requirements, il alcohol used for commercial purposes (e.g., fuel, r varnish-making) must be "denatured," i.e., renered unfit for drinking purposes. This denatured loohol is the ordinary "methylated spirit" of comperce, and consists of alcohol to which has been added mall quantities of other substances, notably methyl leohol, and sometimes a little parafin, benzole, of vyridene, which substances give it an unpleasant taste.

This spirit is sold at a much lower figure than pure alcohol, and is quite suitable for use in motor engines. In order to study the effect of using alcohol in a carburetter, it is necessary to consider the following points: First, every different fuel used in an internal combustion engine requires a certain fixed quantity of air completely to burn it. Thus, if a gallon of benzole is used up, and the mixture of gas and air has been correct, it is found that more air has been consumed than if a gallon of light petrol had been used. Similarly, the amount of air used up is different when alcohol is used. If we admit into the cylinder either more or less air than the theoretical amount, the efficiency of the engine is impaired.

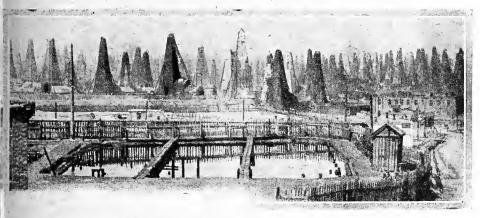

Secondly, when air is in contact with any liquid, it takes up the vapour of that liquid, and becomes saturated. The amount of vapour taken up depends upon two factors: first, the nature of the liquid, and secondly, the temperature of the air; the hotter the air, the more vapour it will take up. With petrol or benzole, the amount taken up by the air at the temperature of the carburetter is more than is neces-

sary to form a perfect mixture.

Consequently, in order to adjust the ratio, it is necessary to admit a certain variable amount of "extra air."

Fuel Value of Alcohol.

When alcohol alone is used in a carburetter intended for using petrol, the amount of vapour taken up is very small when the air is drawn in at ordinary temperatures. If, however, the air is heated before being admitted to the carburetter, it will take up sufficient alcohol to form a good explosive mixture, but, as the calorific value of alcohol is lower than that of petrol (i.e., its explosive force is less), we need more mixture to produce the same effect as with petrol. Conequently, it is not only necessary to heat the air, but also to have a somewhat larger jet and alcohol supply pipe to the carburetter. It is proved by experience that a temperature of 190° C. is a good one for the air. The heating may be conveniently arranged by warming up the intake pipe with exhaust gases.

A typical oil field scene in the Baku district. - Defacement of the landscape could not possibly be more complete.

The Motor Fuel of the Future .-

It is usually necessary to "lag" the carburetter, pipes, etc., in order to prevent the liquid from becoming too cold. In the case of water-cooled motors, the water in the cylinder jacket should be almost boiling, as it is found that too cool a cylinder causes incomplete combustion of the alcohol, with the consequence that certain injurious products, notably acetic acid, are formed in the cylinder. These products are very corrosive and would soon attack the piston, etc., so that many motorists, running on alcohol, prefer to start and stop on petrol, thereby ensuring that any products of incomplete combustion are cleared out of the cylinder before the machine stops, and do not have to lie in contact with the mechanism for any considerable time.

From the above it will be seen that the ordinary fitments for petrol engines are not well adapted for alcohol. It is found, however, that a mixture of two parts alcohol and one part benzole can be used in most of the existing makes of carburetter as readily as petrol-in fact, with marked advantage, as, for some reason not yet fully investigated, the presence of a little water, which always exists in alcohol, gives smoother running. Such water, if present in small amounts only, remains completely in solution and does not separate out in the carburetter, as is the case when water accidentally gets into petrol. (Incidentally, the fact that water mixes freely with alcohol renders it possible quickly to put out an alcohol fire with watera thing which cannot be done with petrol or benzole.)

Alcohol-benzole Mixtures.

The reason why a mixture of alcohol and benzole may be used in place of petrol will be understood when the following facts are considered. In the days of the surface carburetter and low gravity petrol, the mixture entering the cylinder was probably all gaseous. With the spray carburetter and heavier spirit, probably a mixture of gas and finely divided liquid (in the form of mist) enters the cylinder. Such a mixture, provided the liquid is not in great excess, is easily exploded. Probably what happens is that the gas present first explodes, and the heat produced by its combustion gasifies the liquid spray, which then explodes with the air present. It must not be thought that two distinct explosions take place. The following up of one after the other occurs almost instantaneously, so that, in effect, only one explosion is produced.

Slightly Lower M.P.G. Inevitable.

When a mixture of alcohol and benzole is employed, the mixture entering the cylinder contains alcohol and benzole gases and alcohol and benzole liquids (spray) the main portion being, probably, the benzole gas which first explodes, and then gasifies the liquids, which themselves form a further supply of gas for

explosion.

With regard to the power developed by alcohol, i is well to bear in mind that the horse-power produced from a given fuel depends (all other factors being constant) on the calorific value of the fuel. calorific value of a liquid fuel is expressed in B.Th.U (British thermal units) per gallon. A B.Th.U. is the amount of heat which will raise 1 lb. of water 10 F The following figures represent the calorific values o alcohol, benzole, and petrol:

B.Th.U. per gallon. 90,260 Alcohol approximately Petrol approximately ... 145,800 Benzole approximately ... 156,450

Only a fraction of these heat units are actuall developed as useful power in an internal combustion engine, but it may be stated as a general rule tha the higher the calorific value of the fuel, the greate

the m.p.g. of the cycle-or car.

The subject of alcohol as a motor fuel being (i Great Britain) only in its infancy, it is difficult to ge any reliable figures showing how it compares with petrol and benzole in actual road tests; but the fol lowing figures, taken from Clerk's "Gas, Petrol, and Oil Engines," give the result of tests made unde actual road conditions on a motor car, by Prof. E Meyer, in roor.

Fuel % by Weight.		B.Th.U.	di Ci		ific R.P.M.	B.H.P.	Fuel per B.H.P.		% Efficiency		
Atcohol.	Benzole.	Water.		Gallon.		1		January Later per Bill		/0 = money	
87.2 86.4 90.9 85.7 79.1	9.1 14.3 20.9	12.8 13.6 —	10,440 10,350 10,980 11,340 11,808	86,652 85,905 90,036 92,988 98,006	0.83 0.83 0.82 0.82 0.82	280.3 273.3 282.0 278.3 280.2	13.91 13.6 13.87 13.9 14.0	1b, 1,00 1,03 0,968 0,918 0,859	*gations. 0.12t 0.121 0.121 0.118 0.112 0.105	24.3 23.8 23.8 24.3 25.0	

The figures in the columns marked * according to the original paper, but are calculated, assuming the specific gravities to be as above, the low cost at which alcohol will be sold will probably outweigh any consideration of its slightly lower map.g.

MOTOR CYCLE TO HELP EDUCATION.

▼HE Herefordshire Education Committee, as part of some drastic administrative reforms about to be introduced, has decided to apply Lord Fisher's political advice, "Sack the lot," to all the school attendance officers in the county, and to replace them by motor cyclists. The work has so far been done by about fifteen part-time officers; in future it is to be done by five whole-time men, and it is distinctly stipulated that they must use motor cycles in pursuance of their duties. Presumably, they are to provide their

own mounts, and for their maintenance they will each receive an allowance of £50 per year. When the matter was under discussion some members of the conmittee ridiculed the idea of motor cycles being able t surmount many of the stiff gradients with which Here fordshire abounds, especially near the northern an western boundaries. These doubters obviously hav little or no acquaintance with the modern motor cycl and its hill-climbing capacities, and evidently have never witnessed a Six Days Trial!

THIS is not a political article, though it may be said that it is written with the intention of showing how necessary a knowledge of the principles of protection is to the present-day manuacturer of motor cycles. Especially to him who aters for the touring sidecar user.

It is, and has been for a long time, obvious to verybody with eyes to see that the man on the saddle of a motor cycle comes off very badly as regards proection from the slush, mud, and rain which are enountered on the road during three or four months of
ur normal year. And it is for this reason that during
asse months the proportion of motor cyclists to users

Fig. 1.-Mudshield as at present used by many riders.

f small cars or "fords" (it is time this word assed definitely into the dictionary as a common bestantive) drops such an enormous extent. Some thusiastic riders would, I know, take the road in my sort of weather, and with or without muduards, but these are not the people in whom I am mediately interested. I am after the people who ay inside or at home. Until the beginning of ovember, on any of the pleasure routes at a week-ud, more than half the vehicles met with were sider turnouts. The first and second week-ends in ecember showed a considerable difference, there are some observed about four cars to one sidecar.

Apart from the fact that the driver of a motor lecar is not protected directly from the elements, ere is also the front wheel effect to contend with he front wheel acts as a continuous sling for all

The Debatable Question of "Protection" discussed from the Motor Cyclist's Point of View.

the liquid or semi-liquid matter it meets with. If you are steering a true course the engine gets the benefit. Steering to the right your left leg and sidecar are bespattered with mud. A left turn deals with

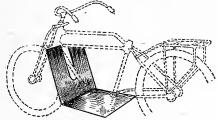

Fig. 2 -An improved pattern, incorporating an under screen.

your right leg, and occasional splashes carrying up as far as your face and goggles complete your mudbath.

But there are mudshields. There are, and most of them you have to buy as extras. These guards have not, except in two or three cases, been designed and built to suit the machine, and anyone can see they are afterthoughts. And yet, as an interested outsider, I know that The Motor Cycle has been asking for these things every winter for donkey's years. What is the reason? Does the trade wish the rider not to use his machine in rough dirty weather, or will it only provide things when the rider goes on strike for them? Is it for the trade to supply only what is asked for, or to foresee what will be wanted?

Two sketches are given showing roughly the kinds of mudshields in use at the present time. Unfortunately, these do not give anything like complete protection for the driver, and will not do so unless developed into something like fig. 4, and the latter

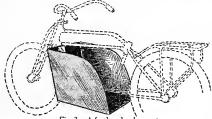

Fig. 3.—A further development.

Comments on Mudgua ding of the Day .-

is only possible with wheel steering. It is rather surprising that wheel steering has not been developed in the case of the heavy sidecar machine. The original T.A.C., which was born a few years before its time, had wheel steering. The only one I ever saw (so steered) was rather exciting to watch on the road. It was driven solo, and its mode of progression along the road resembled a skater doing

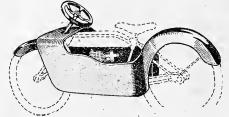

Fig. 4.-A suggested guard.

alternately the outside and inside edge. But the seems to be no reason why wheel steering should nobe made satisfactory for sidecar work. Probably son form of gearing would be necessary as, under certa conditions, direct steering by handle-bars of ewnormal width leaves- much to be desired. It must be remembered that the T.A.C. later model emboding a handle-bar, and the abandonment of the wheel must have been due to the fact that it was not geared.

Reverting to fig. 4, it may be said, why not g a car and be done with it? Quite so, if you hat the cash, but when all is said and done, the sidec is still by a long way the cheapest passenger vehic really on the market and obtainable. A two-seat car costs over double. There is a vast field for t designer in producing a new type of motor cycle, wi which the necessity to wear special clothing is render unnecessary, and, so long as such a design is not up and cumbersome, it will attract many who will n otherwise become motor cyclists.

Who will be the first to give us the fully protect motor cycle, fitted with body, wheel steering, as sidecar to match? Don't all speak at once! C.R.E.

BUYING AND SELLING.

Some Practical Advice to Prospective Purchasers of Second-hand Motor Cycles.

TE are still living in abnormal times, and the shortage of supplies resulting from the war causes a brisk interchange of ownership of motor cycles. This state of affairs must last some time yet, and the moulders' strike has undoubtedly prolonged the period of high second-hand prices. We do not mean to infer that in normal times there is little buying and selling of second-hand machines, as the reverse is the case, but that during the present dearth of new motor cycles, so many of our readers are forced to buy second-hand mounts or none at all, that there is more of this kind of trading than usual, and that secondhand prices are abnormally high. Consequently we get numerous letters from readers who purchase a motor bicycle said to be, say, a 1915 model, and, after having it for some time, find it necessary to apply to the makers for a spare part. They probably ask for, say, a spare exhaust valve for a 1915 -, engine No. ---, and receive a reply to the effect that the valve is sent, but pointing out that the machine is a 1912, and not a 1915 model. This may happen weeks, or even months, after purchase; yet we receive a letter from the victim asking if any redress can be obtained from the vendor. Unless the purchaser can prove that the vendor wilfully deceived him as to the date, there is no remedy, and also the time to take proceedings is at the time of purchase, and not months afterwards. The vendor might quite well have bought the machine as a 1915 model, and have used it with success for a year or two, and have been quite satisfied as to the date. His was a case of "Where ignorance is bliss 'tis folly to be wise,' and he may have acted in perfectly good faith. There he may have acted in perfectly good faith. was nothing to have prevented the victim from taking the engine number before purchase and getting a confirmation of the date of manufacture in a couple of hours. Is the vendor necessarily to blame? The answer is, No! Many readers seem to think that if they send

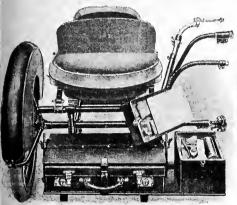

the engine number to us it will suffice. An absu procedure on the face of it, as it is hardly likely this journal has the engine number of every mot cycle engine ever made, no matter of what mak An amateur may be forgiven for having purchased worn or defective machine through lack of technic knowledge, but when the simple precaution of verifing the date is not taken advantage of, the blame reswith the buyer. In several cases machines have n been altered in design from 1914 to 1919, which in itself an example that shows the buyer how careful he must be.

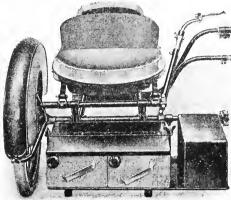

Advice to the Seller.

Now, after a little advice to the buyer, let us sa a few words to the seller. The man who has a good motor bicycle to sell has nothing to conceal. He has but one object in view, and that is to get the ber price he can. To do this he should have the maching cleaned and in perfect order. He should advertise in The Motor Cycle miscellaneous advertisemer columns, giving full particulars and the price. It i best to state a fair price and to stick to it, and i is desirable to give the prospective purchaser confid ence, therefore there is no reason why the engine number should not be stated in the advertisement and if this were done in every case, there would be far fewer cases of dissatisfaction. As there are so many thefts of motor cycles at the present time, no trial runs should be granted unless the value of the machine is deposited in notes; and, if the vendo cannot see to the sale himself, he should depute trustworthy agent to see after the business for him. It is cheaper to pay a small commission than to lose the machine altogether. The Motor Cycle deposit system has been arranged to protect both vendor and purchaser, and we especially warn readers to have nothing to do with those who refuse to take advantage of this arrangement.

Accommodating Luggage on Light Sidecars.

A Grid for the Sporting Canoelet and a New Touring Model.

Left) The Canoelet luggage grid holding two tins of petrol (Right) Showing how an attaché case can be carried, and also interior of the tool case.

is generally supposed that the sporting motor cyclist who decides to fit a light semi-racing type of sidecar omatically forfeits the conveniences luggage accommodation. In contemting the outfit of his younger brother, family sidecarist almost invariably jures up a picture of the former's chine with T.T. bars and a tiny side, resembling a slipper, in which the senger, reclining in a more or less afortable position, is forced to urse? the bag containing the necesies for a week-end jaunt. Many such chines so loaded are to be found in lost every part of the country during summer months, when their owners I companions make a dash to the stand hack again between the closing

of the office at mid-day on Saturday and its reopening on Monday morning; but no longer need the sporting passenger be called upon to carry the suit case, for Messrs. Mead and Deakin, Ltd., of Tyseley, Birmingham, the makers of the Canoelet sidecar, have introduced an additional sporting model, to which may be fitted a useful luggage grid of their design.

A New Model.

This grid goes a little further than the majority of such fitments, and is so constructed that, in addition to a tool box. it will accommodate two tins of petrol, or a suit case, in such a way that they are securely fixed by clamps. The tool box deserves special mention. In the lid

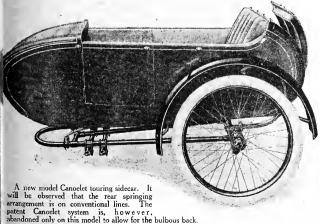

is a separate compartment for the carriage of small tools, while the main box is sufficiently large for the storage of every other tool and spare usually carried.

Another new model of the touring type is the Model MM 4, which differs, both in appearance and in suspension, from the well-known attachment, Model D 4. This sidecar has a bulhous back, containing a locker sufficiently large to hold a tin of petrol or personal luggage, and is sprung at the rear on C springs of the conventional type. We have no doubt that this new model will become as popular as the better known Canoelet.

HOME FUELS.

IT is estimated that if less than half our total coal consumption were treated scientifically every year the whole of the motor fuel we required before the war could be produced in Great Britain. The fact has an interesting bearing upon the efforts that were made by the Motor Legislation Committee to secure amendments to the Electricity (Supply) Act of last session, with the object of encouraging the home production of benzole. As a result, the Electricity Commissioners, who will constitute the central authority for future developments, were given power to "conduct experiments or trials for the improvement of the methods of the utilisation of fuel." Further, the Joint Electricity Authorities, which may be set up under the Act, were emprovered to establish plants for the extraction of the valuable by-products "arising directly or indirectly from the generation of electricity."

Another amendment ensures that any sources of electric supply under the control of the Joint Electricity Authorities will be available for the charging or recharging of electric motor cars.

OUR AMERICAN NEWS LETTER.

Winter Trial in New York States: Medals Awarded to Passengers as well as Drivers.

THE Crotona Motor Cycle Club, of New York City, started the 1920 competition season off well with a 150 miles reliability run that left New York at midnight. The course was via Albany Post Road to Poughkeepsie and return on a 20 m.p.h. schedule. About 68 miles of the run was through ice rutted roads, with snow averaging seven inches in depth. Thirty-six riders faced the starter, and were sent off at one-minute intervals, twenty-seven sidecar outfits and

nine solo machines comprising the field.

The Indian sidecar won highest score with 1,000 points, which took a gold medal and the Hendee trophy. The Indian solo rider with 988 points won a gold medal in his division. The Indian Scout scored in his division. The Indian Scout scored 949 points. A lady driver, with a pas-

senger of the same sex, scored 915 points. The Crotona M.C. will award three gold, twenty-six silver, and nineteen bronze. medals, bronze passengers sharing equal awards with the drivers. The run brought out

much winter equipment, handle-bar muffs, splashboards, and rain clothes being in evidence. Most riders using electrically equipped machines added Kay Bee Spot-lights to their handle-bars, or for the sidecar passenger to operate. These Kay Bee lamps are fitted with 21 c.p. nitrogen lamps and are swivelling, so that all parts of the highway may be illuminated. Three and four lamps were used by some contestants, which gave a light, and permitted of high speeds.

Drastic and sweeping changes to the present motor cycle competition rules marked the semi-annual meeting of the Motor Cycle and Allied Trades Association Competition Committee, held in New York City in January.

Racing Engine Sizes Limited.

The most important changes affect racing on one mile tracks, although other phases of the sport are dealt with.

The growing realisation that modern

motor cycle engines are packing far more speed and power in their 61in. of dis-placement (1,000 c.c.) than when the present rules were formulated caused the committee to cut down the limit of piston displacement. In overhead valve special racing machines, the limit is to 50 cu. in. (819 c.c.), this rule to take effect on and after January 1st, 1921. The year of grace was granted the manufacturers in which to prepare racing engines of the smaller size.

Mr. C. B. Franklin, of the Heudee Manufacturing Co., advised making the limit in the neighbourhood of 46in., so as to conform to 750 c.c. No action was

taken in the matter. For the current year overhead yalve motors may compete on mile tracks, but not mixed in with our so-called stock class. The stock type of motor, of 61 cu, in, piston displacement, may continue to perform on one mile tracks after 1921. Right here we might interpolate that the definition of stock in American motor cycling circles is as vexing a problem as trying to explain the fourth dimension to a lop-eared Laplander. The rule will affect the eight valve Harley-Davidson and Indians, and the new Cyclone overhead valve Excelsior.

Another needed ruling for one mile track competition is the restricting of the number of contestants on the track

at one time. Six riders in one heat or final are all the M, and A.T.A, will

Competitors in a recent American reliability trial. Extension sidecar axles are optional equipment on Indians in the U.S., and a big convenience on rutted roads.

allow, henceforward, evermore. At the same time, no race longer than fifty miles will be permitted on one mile tracks. This is a good rule, for most mile tracks are dirt surfaced. The feature event is the long-distance race, and generally the last on the programme. The track surface has been cut and slashed by skidding wheels, and the dust rises in heavier clouds, obscuring the view of contestants and spectators, the riders are tired, and the sun is low and blinding. All these conditions are the sort of stuff accidents are made of, and that is what the controlling body wishes to avert.

Track Events.

There are no restrictions as to valve construction on tracks larger than one mile, but the cubic displacement is limited to 61in. There are a number of mile and an eighth tracks and two or three two mile speedways in the United States, and well scattered, so as to afford fast riding in many sections of the country. New York City will be without a fast track, the famous Sheepshead Speedway being demolished at the present time,

In hill-climbing contests (and this sor of sport was absolutely like the measles breaking out all over, during 1919) th M. and A.T.A. has made new rulings For the present year four classes will b recognised: 37in. (600 c.c.), which in cludes the Scout Indian and Sport Harley; 61in. (1,000 c.c.), taking in mos of our road machines; 74in. (1,200 c.c.) which includes big valve Indians, C.A.B which includes big valve Indians, CAS Harley-Davidsons, Reading-Standards and Hendersons of former years; and the Solin. (1,300 c.c.) class, which permits the Henderson and new Ace to get interest of the CAS o lid slams down on the 74in. and 80in class. After that time only 61in. and 37in. motors will be permitted to compet in hill-climbs.

Another hill-climb ral that was added was tha compelling a contestant to equip his mount wit a rear mudguard the extends 18in. back from the saddle. In passing it might be well to sa that the California type of bill climb in the contest of the contest of the contest when the contest were compelled to the contest with the contest when the contest were contested to the contest when the contest were contested to the contest when the contested contested to the contested contested contested contested to the contested that the California typ of hill-climb is mos popular here in th States. This sort of climb is pulled in a open field, with a grad varying from a sligh till to straight up. The course is loose surface and riders use chain-sho and riders use chain-sho rear wheels to grip th ground. When a ride competes with a nake rear wheel, and is ur seated, he might as we sit down on a buzz sav as on that spinnin wheel. Hence the cafor a rear mudgnard. For road events, suc

as endurance runs, relia bility contests, economy, and non-sto trials, no limit has been placed on th piston displacement on a machine.

Instead of one national hill-climb an endurance run, the M. and A.T.A. ha decided on sectional championship con

Finding a Winner.

Discussion regarding the road contest for the coming year shows a trend awa from the machine-wrecking, man-killing contest. Both the New Jersey M.C. an Crotona M.C., the leading motor cyclelubs of the United States, have come t the conclusion that modern motor cycle cannot be put out of the running, so the have adopted the slogan for the year "Not how few, but how many cafinish?" The Crotona has in mind May, while the New Jersey Club plan a "dawn to dusk" ride of 308 miles or a fast time schedule. Both clubs wi make use of the unsatisfactory secrecheck to break ties, simply because the have no better method of solving the perplexing problem.

E. B. Holton.

A CAR ON TWO WHEELS.

The American Militor, embodying a 1592 c.c. Four-cylinder Engine, Three Speeds and Reverse, and Pressed Steel Frame forming the Lower Half of the Crank Case and G ar Box.

THE trend of motor cycle design in America has long been approaching the production of a machine which, incorporating the desirable features of a four-wheeled car, will provide the equivalent advantages gained therefrom, and ret retain the tractability, weight and use of handling associated with modern notor cycles. Four-cylindered power nits, combined ignition and lighting generators, and the like, have been in vidence for a considerable time. A great leparture, however, even from the most 'car like' designs has been made in the

car nec designs has been made in the construction of the new Militor., Built originally to provide an inexperive yet efficient vehicle for economic ransporation, either for commercial deivery purposes or as a mode of passenger onveyance, the design and construction of the Militor was, during the war, reatly influenced by the exhaustive ests to which it was subjected by the unerican Ordnance Department of the Inited States Army, which were reuired to ascertain the rigidity of the rame construction, and to set a standard of efficiency which would be adequate or the abnormal wear experienced under attlefield conditions. With this fact in ind, therefore, the unconventionality it he general design and the provision of a reverse gear, a substantially designed the recognised as the result of attempting to provide for every emericancy in war service conditions.

Sprung Front and Rear.

The general appearance of the machine once suggests heaviness; the use of a se-piece steel stamping, however, for le frame, considerably reduces the apprently excessive weight. A patented rung suspension is employed for both le front and rear wheels. The former modies two coil springs, located in the ont fork tubes, which are totally encesed by lubricated sliding sleeves. The ont axle is of special design, which is ustructed to absorb head-on shocks of

the Crank Case and G ar Box.

considerable pressure, and when the machine, during its trials, was driven at thirty miles per hour into stone abutments this component successfully withstood the shocks. The rear wheel suspension consists of two quarter-elliptic

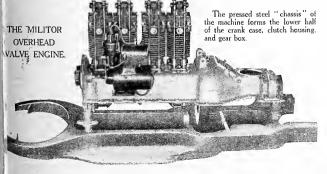

The sturdy frame construction of the Mhitor will commend itself to users of powerful sidecar outfits.

three-leaf cantilever springs, mounted on a patent rear axle construction, which controls the spring deflection in every direction, and evenly distributes all unequal stresses transmitted through the rear wheel. This stabiliser also controls the angle of tilt when the machine and sidecar (which latter is mounted similarly to the rear wheel on semi-elliptic springs, and is attached to spring pads bolted to the stabiliser) are turning a corner or riding on uneven roads. The device forms a combination of double spring suspension, and provides a posi-

tive control of balance. The main frame steel stamping constitutes the lower half of the crank case, clutch, and gear boy housing. The upper half of these two latter is cast integral with that of the crank case. Hence the complete power unit and transmission, less the propeller shaft, can be litted bodily out of the frame, thus exposing all the internal mechanism.

Overhead Valve Engine.

The four air-cooled cylinders, having a bore and stroke of 64 mm. and 89 mm. respectively (1,592 c.c.), are held separately to the crank case by means of bolts. The detachable heads are held by holts located in the top of the cylinder castings. Overhead valves are used, whilst the rocker arms are efficiently lubricated. The ignition and lighting generator is mounted on the near side of the crank case, and is driven from a helical pinion engaging with another pinion on the front end of the crank-shaft. An 8in. diameter dry plate multiple-disc clutch transmits the power through an enclosed flywheel to a selector type gear box, which, in addition to the three forward ratios, is provided with a reverse gear. The gear lever, situated below the saddle, is not fitted with a gate, but is capable of moving on a swivel head in any required direction. Two universal joints at either end of the propeller shaft permit generous movement of the rear wheel. Great attention has been paid to cleanliness.

A Car on Two Wheels .-

The rear mudguard, which is heavily valanced, is held by bolts beneath the rear spring retaining plates, whilst the wide front guard is fixed by stays bolted to the front forks. A triangular construction, with which is incorporated the struction, with which is incorporated the steering head, supports the front forks and tank, which latter, having a capacity of 3½ gallons of petrol and 1½ gallons of oil, is held at the rear by supports bolted to the flywheel housing. A gauze screen is fitted on each side of the engine to protect the legs. Front wheel brakes are entirely dispensed with, the braking being located in the transmission control of the second of the secon

sion system. Force feed lubrication from a postive drive oil pump located in the oil sump of the main frame stamping

The rear mudguard of the Militor is of sensible dimensions.

adequately lubricates all the engine bearings through a hollow crankshaft, whilst the cylinders are lubricated by splash.

A kick-starter of new design is incorporated in the gear box assembly which, engaging with the transmission gears, gives an accelerated rotation to the crankshaft. The control of the electrical equipment follows standard American practice, the lighting and electric horn controls are mounted on a handle-bar instrument board, in the centre of which is fixed the speedometer. An air cushion sprung saddle is mounted on the rear mudguard assembly.

This machine will be handled in the United Kingdom by London and Mid-land Motors, Ltd., 445, Oxford Street, London, W.1.

A 500 cc. DUAL-PURPOSE MOUNT. The 3½ h.p. Coventry Eagle with Abingdon The 1920 Coventry Eagle is a "King Dick" Engine. pleasing though conventional design. A 499 c.c. engine and a Sturmey-Archer gear are fitted.

T may be said that there are three distinct classes of motor cycle pro-First, that consisting of firms manufacturing their machines throughout, including engine and gear box; secondly, those who buy from specialists engines or gear boxes or both, and build a machine to their own design; and thirdly, those who merely assemble, bought engines, gear boxes, and frames.

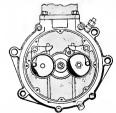

Motor cyclists will appreciate that there

is almost as much scope for the manufacturer who buys only the main components as with those who make all parts themselves, and it is surprising the difference in design between machines embodying practically the same units. The bending of a top tube, the angles of the down tube, an inch on or off the wheelbase, and the rake of the steering head, all contribute to the quality of design.

Graceful Appearance.

Some machines look awkward, unduly large, and clumsy. Others have an appearance quite the reverse, and the Coventry Eagle 3½ h.p. illustrated is one of the latter—a machine following quite conventional lines, yet neater and more symmetrical than the majority. It will be seen that such a machine is a very good step between the two types of machines designed essentially for solo and sidecar work respectively, and therefore suitable for either purpose.

The Abingdon King Dick engine with which it is fitted is perhaps not so well known to recent comers to the motor cycle

Internal cam mechanism of the engine used in the Coventry Eagle.

field as it deserves to be. It needs no introduction to the pre-war motor cyclist, to whom its very good qualities are known. For the benefit of the former, however, we mention that it has side-by-side valves, operated through bell crank rockers by internally cut cams. The exhaust valve lifter mechanism is enclosed. The bore and stroke are 85 mm. and 88 mm. respectively, the capacity being 499 c.c

Chain-cum-belt Transmission.

A Sturmey-Archer gear box forms the gear unit, and a handsome cast aluminium case encloses the driving chain. The final drive is by belt. The equipment of the machine is first-class in every way, including Brampton forks, aluminium footboards, and well-designed mudguards, while Ace disc wheels are fitted when so ordered.

The manufacturers are the Coventry Eagle Cycle and Motor Co., Coventry, a firm founded in 1890, and they also market J.A.P. and Villiers-engined lightweights following similar lines to the 31 h.p. model illustrated.

AIR-COOLING.

A Lecture by A. H. Gibson, D.Sc., before the Institution of Automobile Engineers,

ON Thursday last a most interesting lecture was given before the Institution of Automobile Engineers at. Chamber of Commerce, Birmingham. The subject—air-cooling of petrol igines-is one that is of intense interest all motor cyclists, particularly in view the amount of discussion which has cently taken place on this matter. The cturer, Dr. A. H. Gibson, of University ollege, Dundee, is particularly well allified to speak on this subject, as rring the latter part of the war his forts were entirely devoted to research air-cooled aero engines, which was rried out in a most thorough and stematic manner.

Choice of Materials.

The evlinders on which the lecture is sed were of considerably greater capaty than any that are used for motor cle work, and in consequence presented eater difficulties. In view of this fact eater difficulty obtained will probably me as a shock to those interested in tor cycle design. Perhaps the most iking features of the lecture were Dr. bson's comparisons of different cylinder sterials, and in particular the results tests carried out on similar cylings constructed of (1) all steel; all steel with aluminium cap lted on; and (3) steel cylinders th cast-on aluminium head. We usider the whole question to be important that we make no apologies quoting at length, in the hopes that may take to heart the lessons to be rned, so that in the future we may tain better, lighter, and more economimotor cycles. Present-day design has gnated to such a degree that it would pear as if few people realised that impear as if the people featised that in-vernent in cylinder design is possible l essential, and that cooling ribs and be designed (not guessed), and it their disposition is most important. yone who has studied scientifically the nt problem of air-cooling and motor les must be struck with the fact that ny modern productions have massive ling fins where they are not particuy needful and a minimum of cooling a in the most vital parts. Probably main reason why such designs are n moderately successful is that their ciency is so low. It is a very notable that recent experiments have proved t an increase of power is often accomied by a decrease in petrol consumpi, thereby showing an increase in ziency in two directions at once. he following extracts from the paper

quoted verbatim : LAWS OF AIR-COOLING.—The cooling 'aces of the modern air-cooled cylinder ost invariably take the form of a es of fins, though in some special is cooling spikes may be used with antage over certain portions of the nder. A large number of tests have 1 made to determine the rate of heat

dissipation from such surfaces, with results which show that for wind speeds between twenty miles per hour and sixty miles per hour the heat loss is sensibly proportional to the mean temperature-difference between the fin surface and the incoming air, and to the 0.73 power of the wind speed. For a given material the heat dissipation is sensibly independent of the roughness of the surface. Different materials have slightly different dissipation coefficients. A steel surface appears to give somewhat greater heat dissipation than an aluminium or a copper surface, the difference being, however, only about five to ten per cent. The dissipation from cast aluminium fins appears to be improved by a coating of suitable stoving enamel, the difference between the enamelled and plain fins being about ten per cent.
"Over the range of cylinder sizes usual

in practice, the dissipation coefficient is sensibly independent of the cylinder diameter."

"SHAPE AND SIZE OF FINS.—The fin which gives the maximum heat-loss per unit of weight is one having slightly concave surfaces and a sharp tip. It may be shown, however, that a plain tri-angular fin is only very slightly less efficient. The best proportions for such a fin depend on the conductivity of the material and on the wind speed.

"If such a fin be truncated until the tip breadth is one-fifth of the bottom breadth, the lengths become 80% of those given above. The heat dissipation is about 0.88 times and the weight 0.96 times as great as for the complete triangular fin.

The Shape of Fins.

"Since the heat dissipated from a fin of given shape varies directly as the length of the fin, while the weight varies as the square, of the length of the fin, other things being equal, cooling fins should be as short as possible, a large number of short thin fins being used in preference to a smaller number of longer and thicker fins. While in practice this is to be borne in mind, many other factors besides that of weight have an important bearing on the best size of fin to be adopted. Thus, in a thin steel cylinder, or in a cylinder of cast iron or cast aluminium alloy, the circumferential ribs add greatly to the strength and resistance to distortion. Comparatively deep and heavy fins have a greater effect in this direction than a larger number of similar but smaller fins giving the same cooling. Again, as the number of fins is increased, the pitch is correspondingly diminished. This dimicorrespondingly diminished. This diminution in pitch reduces the air flow between the fins to an extent which may, with very small pitches, render the fins practically useless for cooling purposes.

"In a cylinder of cast iron or of aluminium alloy, foundry difficulties put a definite limit to the minimum pitch of

the fins."
"Foundry difficulties also prevent the casting of a fin having a tip less than about 0.5 mm. in thickness, or a root thickness less than about l/10, so that an aluminium fin 1in, long would not have a root thickness less than 0.1in.

The amount of heat dissipated from the internal surfaces of a petrol engine depends very greatly on the amount of oil reaching these surfaces. Where the oil supply is only sufficient to give adequate lubrication, this component of the heat dissipation is reduced: more heat must be removed from the outer cooling surfaces, and the cylinder temperature is increased. Variations in the degree of cylinder lubrication readily explain many of the inconsistencies which have been observed in temperature measurements on cylinders otherwise apparently similar.

Effect of Mixture Variations.

"DESIGN .- The influence of design is shown by a comparison of two engines, one with overhead valves, and the other an L-shaped head. The L-head cylinder transmits approximately eighteen per cent, more heat per b.h.p. to the walls than does the overhead valve cylinder. In this L-head cylinder the design was probably as clean as can be obtained with such a type of cylinder.'

" The strength of the working mixture has a very appreciable effect on the heat transmitted to the cylinder walls. The hottest cylinder is obtained with the weakest mixture capable of maintaining maximum load. This is roughly a 13.5 to 1 air/petrol mixture. Any weakening of this mixture not only reduces the brake horse-power, but also the heat-loss per b.h.p., and so in a double degree tends to give a cooler cylinder. At the same time it gives an appreciably hotter exhaust, and so tends to cause overheating of the exhaust valves."

"FUELS .- The amount of heat transmitted to the cylinder walls varies somewhat with the composition of the fuel. The author has no evidence to show how it varies with the quality of the petrol, where this is used. A number of tests have, however, been made with petrolbenzole mixtures, with results that show :

'(a) The heat transmitted to the walls per b.h.p. is somewhat less with a 20% benzole mixture than with petrol. "(b) The difference increases with

the compression ratio.
"(c) The difference increases with the

enginé speed. In the case of the single-cylinder Mercédès engine the difference was:

"1.0% with a compression ratio of 4.0% with a compression ratio of

5.0%, "3.0% with a compression ratio of

at a speed of 1,400 r.p.m.

"As the power developed under normal conditions is about 5% greater with a 20% benzole mixture than with petrol, the total heat transmitted to the is sensibly the same with either fuel,

MOTOR (YCLE

A r-cooling .-

"This is borne out by the results of tests on an aluminium air-cooled cylinder. tested with Shell A petrol, and with a mixture of Shell A and 25% benzole. In this case the compression ratio was 5.0. At the same speeds the benzole mixture gave 5.3% more power with a 21% increase in consumption by weight. The maximum cylinder temperatures The maximum cymnaer temperature were, nevertheless, sensibly identical, the were, nevertheless, than 5° C. The difference being less than 5° C. The difference is, however, very marked where, owing to insufficient cooling or a very high compression ratio, severe pink-ing or detonation is caused when working on petrol.

Cooling Sur.ace Area.

"WORKING TEMPERATURES .- Experiment shows that the maximum temperature of the head of an air-cooled cylinder shoul? not exceed about 270° C. for satisfactory working. With maximum temperatures of 200° to 220° C. results, both as regards petrol consumption and brake mean effective pressure, can be obtained, which are quite as good as those from a water-cooled engine of similar design and size. If the temperature exceeds about 280° C., trouble is usually experienced through pre-ignition, and plug trouble becomes apparent, but this is more marked on some cylinders than others.

"In a well designed aluminium cylinder of the overhead valve type operating in a 60 m.p.h. wind, experience shows that a provision of from 0.28 to 0.35 sq. ft. of cooling surface per h.h.p. is adequate to give the required temperatures under normal conditions of operation, the larger area applying to cylinders of about 4in. bore, and the smaller to cylinders of about 6in, bore. For steel or cast iron cylinders with overhead valves, this area should be increased by about 50%, and for L-head cast iron cylinders by 100%.

"The table shows the minimum air velocity necessary for first-class performance of air-cooled cylinders of good design and material under normal full throttle conditions.

Diameter.	Velocity.
in.	m.p.h.
3	30 40
· 4	50 70 90
8	90

" It is true that cylinders may be successfully operated on considerably lower air speeds, but only with reduced output and on appreciably higher petrol con-sumptions" sumptions.

"For cast iron L-head cylinders the maximum air blast should be increased by at least 50%."
"CYLINDER MATERIALS.—With cylin-

ders of normal design, the middle portion of the head is the hottest point. The difficulty of keeping it satisfactorily cool 's mainly due to the fact that the free air flow is impeded by the inlet and exhaust valve ports and valve gear, and that owing to the presence of these ports it is almost impossible to provide adequate cooling surface at this point. This results in the heat having to travel outwards, to be dissipated mainly from the cooling

surface surrounding the combustion head."

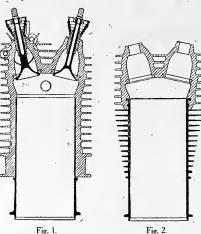

"FOR ALUMINIUM CYLINDERS.—The valve seats may consist of rings of steel or of bronze, and these may be either cast or expanded into position. Both methods and both materials have been used with success" (fig. 1).

"Tests have been made with screwed-in steel liners, but with unsatisfactory

results."

"In one system of composite con-struction the aluminium casting has been confined to the cylinder head, and into this has been cast or screwed the steel barrel, with its own steel cooling fins, as shown in fig. 2. Mechanically, this system has proved sound."
"In another system, exemplified in a

well-known series of engines, the barrel and head are formed of steel in one piece. An aluminium cap, embodying the inlet and exhaust ports, is secured to the cylinder head by a series of bolts. This type is intermediate between the aluminium-headed cylinder and the allsteel cylinder."

"An interesting series of tests has been carried out by the author on a series of three cylinders, differing only in the construction of the head. In one case this was of steel, with one aluminium inlet and two cast iron exhaust ports bolted to its outer surface. In the second case, an aluminium cap was fitted to the head of the same cylinder; and in the third case the original head was cut off, and an aluminium head was cast on to the same barrel. The cylinder diameter was 51 in. x 61 in. stroke, and the comprossion ratio 4.6. The tests were carried out at 1,450 revs. per minute, and in a wind of eighty-two miles per hour. The results showed that under maximum load conditions the aluminiumheaded cylinder gave fifteen per cent. more power than either the steel cylinder or that with an aluminium cap. petrol consumption of the aluminiumheaded cylinder was twenty-six per cent. less than that of the steel cylinder, and twenty per cent. less than that of the capped cylinder.

"CYLINDER DISTORTION .- Other things being equal, cylinder distortion will be proportional to the difference of temperature between its hottest and coldest sides. Temperature distortion of the head itself is not usually serious, if the head itself is not of composite construction. One of the objections often raised against aircooling is that an air blast on one side of a cylinder leads to excesive distortion of the barrel.

Temperature Differences.

"In such cylinders the differences of temperature between the two sides of the barrel depend entirely on the way the blast is applied. The exhaust side is normally the hottest, and by applying the blast to this side the difference of temperature between the two sides may become comparatively small. As an example, the following figures taken from tests on a 5-in. air-cooled aluminium cylinder may be of interest. With the blast on the exhaust side of the cylinder, the maximum difference of temperature

between the front and back of the barrel was 58° C., while the mean difference was only 19° C. With the blast on the opposite, the inlet, side, the difference of temperature rose to a maximum of 180° C. and a mean of 120° C. In spite of this however, the cylinder, which was fitted with an aluminium piston having 0.025in. clearance, only showed no signs of binding after a prolonged run, showing that even in this extreme case and in a cylinder of this size, the distortion was not serious."

The discussion was most interesting, and the speakers included such well-known air-cooled enthusiasts as Messrs. G. Lanchester, F. M. Green, A. W. Reeves, A. H. R. Fedden, Granville Bradshaw, T. S. Irvine, A. E. Parnacott, and others.

All agreed as to the extreme value of the paper

as being based on actual results, which could be repeated, and the chairman, Mr. G. W. Watson, and others, referred to the paper as a classic. Certain manufacturers pointed out that

the ideal cylinder for aero work was not necessarily the most suitable for auto-

mobile practice.

Dr. Gibson, in the course of an able reply, pointed out that in the case of the comparatively low power output required for standard automobile work, cast iron or steel cylinders should prove quite satisfactory.

There were present at the meeting a very small number of motor cycle signers, and we cannot help feeling that by the absence of further representatives the motor cycle industry has lost a great the motor cycle mausery has not a great opportunity of obtaining some most valuable information upon a subject which affects their products vitally, but of which very little reliable information is available. The complete paper will be in the part is the par available. The complete paper will be published in the next issue of The Automobile Engineer, the official organ of the

Automobiles in the U.S.A.

It has been estimated that there are 7.602.000 automobiles—either passenger or commercial—" officially listed" in the U.S.A.

Institution of Automobile Engineers.

The Graduates' Section (London Branch) of the Institution of Automobile Engineers announces that a paper on "Steering Gears" will be read by Mr. F. R. Cowell on February 12th, at the offices of the Institution, 28, Victoria Street, S.W.1, at 8 p.m.

Busybodies.

The Executive Council of the County Councils Association, last week, adopted the resolution of the Wilts County Council, that the strongest representation should be made to Parliament for immediate measures to constitute pillion riding a punishable offence.

A Straw in the Wind.

"Prices on one make of machine," says a correspondent in New York, "have dvanced guite a deal. I will not mention names, but the lone firm will soon be joined by the rest of the manufacurers, and if the increases keep up they will soon match British prices that at the present look sky high to us Americans."

International Voilurette Race.

The Automobile Club de l'Ouest will hold a race for cycle cars and small cars over a 400 kilometres course in the neighbourhood of Le Mans on August 29th. The engine cylinder capacity must not exceed 1,400 c.c. Entrants should communicate with the A.C. de l'Ouest, 54, Place de la République, Le Mans.

The Renovation of Old Models.

So many of our readers ask us for information concerning the fitting of countershaft gear boxes to old pattern but reliable motor cycles that we should be glad to have some particulars on this subject as to the cost of fitting, amount of alteration necessary, and any further details which would help other readers of The Motor Cycle. Deliveries of new models are still all too slow, and many riders are desirous of bringing old pattern machines up to date.

Engelsche as She is Wricht!

The following curiosity has been received from Holland by Zenith Motors, Ltd.: "Y to look about near Engelsche House which to make Motorcycles 4 Stroke one and two cylinders of 2\frac{3}{2} to 9 H.P. Solt you so iriendly will to be my to give antwerd of your House is represente in Holland for Sole agent. Can you deliver motorcycles. When can you deliver. How much stuks for seisoen 1920. Which motorcycles can you deliver, and wath price and wath condition. Please will you do astre your give my up. You asure that y your wrichting solt to recieve with to most interest. Your Faitfully." Then follows a signature, which is absolutely illegible.

Special Features. ALCOHOL AS A FUEL.

MUDGUARDING, A RADIAL ENGINE.

What Then?

In a report from the Bureau of Mines in the U.S.A. it is stated that probably all existing underground reserves of oil in that country will be exhausted by 1928,

A Smart Capture.

An A.C.U. member left his Douglas combination in a Bournemouth street recently while he made a call. On returning to the spot a few minutes later he found that the machine had disappeared. He immediately telegraphed to the Union's headquarters in London, where details of the combination were received at 11 a.m. The headquarters staff at once took steps to inform their road guides throughout the country of the loss. At 2.30 p.m. the same day the missing Douglas was recognised by a road guide in Basingstoke and was duly secured.

The Moto Club Liégeois.

The oldest motor cycling club in Belgium, the Moto Club Liegeois, has recently been authorised by his Majesty King Albert to take the title of Royal Moto Club Liegeois. Sixty-five members of the club joined the Army at the outbreak of war and they distinguished themselves as despatch riders, in the air, and technical services, and in fighting corps. Moreover, at the beginning of the war, the R.M.C.L. formed a corps of fifty despatch riders, who rendered great services, especially in reconnaissance work in the German lines. The R.M.C.L. will promote four big events this year: A winter trial in March, a two-days trial in May, the great international event, Paris-Nancy-Liège, in August and a great trial in September.

S Parker (Bolton), H. Petty (Leicester), and V. Horsman (Liverpool), who are all riding "Big Four" Norton sidecars, will compete for a team prize.

Colmore Cup Finai

The first two, entries received for this classic Midland trial are Frank Whitworth (Premier Runabout) and Howard R. Lane

Paris-Nice Triai.

The Paris-Nice entry list closed with 114 names. It is expected that the starters will number about 100. The weighing and sealing of British machines will be on the 11th inst. at 8.30, a set time being fixed for each competitor.

American Champion Ki'lel.

MOTORS FOR POLICE WOMEN.

THE MOTOR CYCLING CLUB ANNUAL GENERAL MEETING.

HE annual general meeting of the Motor Cycling Club was held at Pagani's Restaurant, at 6.30 p.m., Wednesday last week. In the absence the president, Lt.-Colonel Charles ott, O.B.E., the chair was occuby Mr. R. H. Head, chair of the committee, who put the lad report to the meeting, and it was mimously adopted. He regretted the acc of their president, but hoped to be would be re-elected. He then seed Colonel Jarvott's election to the whe would be re-elected. He then osed Colonel Jarrott's election to the which was duly seconded, and ed unanimously. The following vice-dents were then re-elected: Messrs. rt Brown, R. C. Davis, E. B. Dick-C. J. Jenkins, S. H. Fry, J. Vandonk, J. A. Jackson, Ernest Perand Harry Smith. Mr. W. H. swas then elected captain, and in Jurse of a short sneech ha said that ourse of a short speech he said that ould endeavour to keep up the social of the club. The following officials

were then re-elected: Hon. secretary, Mr. Southcomb May; hon. treasurer, Mr. L. A. Baddeley; auditor, Mr. W. Richards. The next procedure was to elect the 1920 committee, and while the scrutineers—Messrs. Vivian Olsson and servitineers—Messrs. Vivian Olsson and Edward Pond—were counting the votes. the Chairman made a brief announcement concerning the 1920 programme, mentioning, as the principal events, the opening run on March 15th to the Old Ship Hotel, Brighton, the London-Edinburgh run at Whitsun, a meeting at Brooklands in July, the team trial for The Motor Cyple Challenge Cup on June 26th, a run to Devonshire in Angust, and the winter run in December.

Mr. W. H. Wells then made some interesting proposals regarding the London-Edinburgh run. He suggested that a detour should be made from the Great North Road into Westmorland and Cumberland, comprising such hills as

Tow Top, Staveley, Kirkstone Pass, and others, finally joining the western road to the north of Penrith. This would add about fifty miles to the journey. It would naturally make the run more difficult, and the medials really worth winning, and would take the place of the return journey from Edinburgh to London, as part of the run.

This wengest was not with consider.

This proposal was met with considerable approval. The Chairman then stated able approval. The Chairman then stated that it was proposed to offer prizes of silver-plated ashtrays, with the club's silver medal in the centre, cigarette boxes, or match stands, on which the club's silver medal was mounted, as attemptives to gold medals. alternatives to gold medals.

The following were elected members of the M.C.C. Committee for 1920: Messrs. R. H. Head, A. Candler, E. A. Bridgman, W. Cooper, P. G. E. James, R. G. Bell, B. Marians, C. G. Seed, B. A. Hill, E. M. P. Boileau, and S. R. Axford.

CLUB NEWS.

The Stalybridge and District M.C. will hold its annual general meeting at headquarters, on the 16th inst., at 7.45 The annual dinner will be held at the Pit and Nelson Hotel, Ashton-under-Lyne, on the 27th inst., at 7.30 p.m. The hon. secretary is Mr. G. E. Watts, Balmoral House, Stalybridge.

Surrey M.C.C.

The first post-war annual dinner and distribution of awards took place at the Angel Hotel, Guildford, on Wednesday, January 28th.

Finchley and District M.C.C.

At a rally of Finchley motor cyclists, held at the Orange Tree Hotel, Friern Barnet, on the 23rd ult., it was decided to form a motor cycling club for Finchley and district. The following temporary officers were elected: Chairman, Mr. R. J. Lisles; hon. sec., Mr. Bernard Staley, Burnage, Victoria Avenue, Finchley, The question of amalgamation with the The question of amalgamation with the Middlesex Motor Cycling Club was discussed, and it was decided that as there were sufficient promises of support not to agree to amalgamate for the time being, A general meeting is called for February 6th at the Orange Tree Hotel, Friern Barnet, at 8.30 p.m.

Newcastle and District M.C.C

There was a representative attendance of motor cyclists at the annual meeting of the Newcastle and District M.C., held on the 27th ult., when Mr. F. Keir

It was reported that Messrs. Travers, of Newcastle, were anxions to present a trophy for a hill-climbing competition for clubs affiliated to the North Eastern Automobile Association, to be organised and run by the club, and that gold medals and run by the club, and that gold needs would accompany the trophy. In addition, Mr. Murray offered a rose bowl, and Mr. Lister offered a cup for individual club events. All offers were accepted with thanks.

Mr. Clifford Allison, a pre-war member of Sutton Coldfield Club, now of New castle, joined Mr. James Cooper in the capacity of ionit compatition secretary.

capacity of joint competition secretary Mr. W. Robson Lister was re-elected gen. AIT. W. RODSON LISTER WAS YE-FIECTER gen. sec., and the committee elected comprised Messrs. G. Batty, C. Allison, S. Bell Geo, Roper, W. C. Crompton, W. Spoors. Jas. Reed, W. Baxter, F. Keir, H. Brogden, G. Middleton, J. S. Pendleton, and J. L. Murray. The rules were amended in such a way as to remove al

trade distinctions.

The Cambridge University M.C.C. is already showing enthusiasm, several of its members participating in a club run last week endthe first of many arranged for the year.

club News .-

Scarborough M. and M.C.C.

The first annual meeting of the newly-formed Scarborough and Dis. M.C. was held at the Victoria Hotel on Monday of last week. There was an attendance of about thirty members. The hon, sec. s Mr. W. Marriott, 28, Gladstone Road.

Kidderminster M.C.C.

A spirit of optimism prevailed at the ecent annual meeting of the Kidderminster J.C.C. Much satisfaction was expressed at the position of the club financially, aking into consideration the difficult ircumstances under which the club had arried on during the past few years.

Mr. J. G. Nixon was unanimously relected captain, and thanks accorded for is past services to the club. Mr. Derrick turcher was elected as vice-captain, and the following were elected on the com-nittee: Messrs. R. Grove, jun., R. ritchard, W. H. Walker, T. Jenks, G. ritchard, W. H. Waiker, I. Jeriks, C. lilton, and R. Stone. Mr. Gilbert ritchard, Bewdley Road, Kidderminster, as elected as hon. sec., Mr. C. Brown as assistant hon. sec., Mr. A. W. Lucas as re-elected treasurer, and Mr. Reg. 'ritchard as trial secretary.

; utton Coldfield and North Birmingham A.C.

Entry forms for the Colmore Cup Trial, on Saturday, the 28th inst., will he sent immediately on receipt from the printers. The organising secretary is Mr. Phil. Mosedale, The Nook, Maney Hill Road, Sutton Coldfield.

North Wilts M.C. and L.C.C.

Wednesday last week a wellattended and very enthusiastic meeting was held at Lay's Restaurant, Swindon, to inaugurate the North Wilts Motor Cycle and Light Car Club.

Mr. E. C. Skurray, having consented to accept the presidency, opened the meeting with a splendid speech in which he out-lined the necessity of and benefits such a club would offer motor cyclists in the district. Mr. Skurray made a generous offer to present the club with a cup for competition. The only condition attached to the gift is that it is to be won three times before it becomes the property of the competitor.

Some eighty prospective members were present, which, considering the bad state of the weather, was most gratifying, and many who were unable to be present wrote assuring the club of their support. The headquarters of the club are at the King's Arms Hotel, where the next general meeting will be held on the 18th inst. The subscription has been fixed at £1 1s, per annum. The secretary pro tem, is Mr. A. R. Norris, 26, Kent Road, Swindon.

N.M.C.F.U. (Rotherham).

The Rotherham Branch of the N.M.C.F.U. held a highly successful meeting in the Y.M.C.A., Howard Street, on Friday last. Officials were elected, and many interesting problems discussed, particularly the new taxation proposals, and the following resolution

was unanimously carried:
"That this branch of the N.M.C.F.U. urges the executive to protest against any further taxation on motor cycles and sidecars, as it is considered that the present method is totally adequate, and any further tax would be an imposition on those who use their machines primarily for pleasure, and who do not do any excessive damage to the roads."

Meetings are arranged for the last Friday in each month, but owing to the large amount of business requiring im-mediate attention, it was decided to hold a meeting on Friday, the 13th, in the same room at 7.30 p.m.

THE THURLOW CYCLE CAR.

crank pedal of the latter has been fixed an extension shaft, which

protrudes beyond the

off side longitudinal chassis member, and bolted to this shaft is

a long handle, held stationary by a spring clip fixed to the front mndguard. This fitting

not only enables the driver to start his

engine from the seat,

but the great leverage afforded by the length

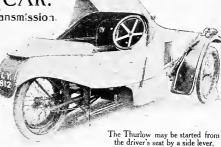

A Simple Three-wheeler with Motor Cycle Transmission.

THE Thurlow three-wheeled cycle car, which, although under construction and experiment for several years, as but recently been redesigned, will, ithin a short time, be placed on the arket by the designer, Mr. Thurlow, Kingston Road, Wimbledon, London,

W.19. Tubular chassis construction is ed throughout, the simplicity of which a marked feature of the car. -

The power unit, which at present is 1 8 h.p. twin Precision, is conveniently sposed at the forward end of the chassis. Fellows magneto is mounted on a plate ed to the off side of the crank case, id is driven by a roller chain. Carbution is supplied by an Amac single-lever rburetter, which has, during the ex-ustive tests to which it has been subitted, given great satisfaction. On moving the bonnet the forward as embly pears to be somewhat complicated. is impression is probably due to the genious method of crowding the com-

of the arm greatly facilitates the rotation of the engine. Further, to reduce the difficulty of engine starting, an arrangement is fitted to the starter extension shaft, which, for half of the arc described by the handle, raises the exhaust valves from their seatings, and when this period has been covered ete transmission system beeen the false radiator and e dash. Mounted directly hind the engine is a The redesigned Thurlow threewheeler has transmission. chain - cum - belt urmey-Archer three-speed ar and kick-starter. To the

the valves drop, and the resulting full compression, with the engine turning at a moderate speed, ensures a rapid start.

Chain transmission is used only from the engine to the gear box, and a long belt subsequently transmits the drive to a belt rim on the rear wheel. clutch is incorporated in the gear box, and is operated from a pedal located on the left side of the accelerator.

Efficient front and rear springing is uployed. In front laminated springs employed. anchored to tubular radius rods, considerably decrease any side sway. The patented rear suspension consists of a sub-frame supported by the single rear wheel, which is free to move about an axis. Monnted between the rear axle and the point of rotation of the sub-frame are two helical springs. This suspension similarly obviates the amount of lateral sway usually experienced on single wheel rear-driven cycle cars.

Two brakes are provided, the rear one of which, controlled from a handle on the off side of the body, acts on the rear belt rim, whilst the second is brought into action by a further depression of clutch pedal which forces a brake block between the flanges of the gear box pulley.

The Editor does not hold himself responsible for the opinions of his correspondents,

All letters must be addressed to the Editor, "The Motor Cycle," Heriford Street, Coventry, and must be accompanied by the writer's name and address.

RUSTLESS STEEL RIMS.

Sir,—I was much interested in your article on stainless steel. Would it not be possible to have rims made of this? They are the parts most subject to rust, and it is most essential to keep them free of it to prolong the life of the tyres.

JOHN J. ARNOLD. [Certainly; the only obstacle is the cost .- ED.]

THE "BUMP" CYCLE.

Sir,-Doubtless many of your readers have been much amused by the account given in The Motor Cycle of the Bump hicycle.

The absurdity of the arrangement should be obvious when one considers that the energy required to work the motor can only come from the rider himself (except, of course, when going downhill). The arrangement really comes to dividing the drive between the pedals and a machine of very doubtful efficiency, actuated by the saddle and front forks. It is obvious that the overall efficiency cannot be increased this

Furthermore, I worked out the maximum power which would be derived from a Bump motor travelling at 15 m.p.h. It came to ½ h.p. It might be confidently expected that such a motor would be able to drive its own chain, but, I fear, very little else.

It is indeed surprising that such an idea should have been embodied in a proposition intended for the market. HAROLD J. POOLE, B.Sc. (Lond.).

HOW MOTOR CYCLES ARE STOLEN.

Sir,—In reference to "J.W.B.'s" letter published in your issue of January 15th, I regret to say that a machine I advertised on January 8th was stolen in a very similar manner. A pleasant, well dressed man, age about 27, height 5tt. 8in., light brown hair, clean shaven, called and stated that he was a chauffeur. You will note that the description is exactly that of the man who stole "J.W.B.'s" machine, and doubtless he is the same. He called one Studay evening and doubtless he is the same. He called one Sunday evening and arranged to bring the cash and take delivery of the machine early in the week. In course of conversation he obtained my business address, and on Monday called on me with the request that I would give him a guarantee that the bicycle was in running order. I accordingly wrote out a short form of guarantee and gave it to him. He then sent a forged telegram, in my name to my mother, stating that I had just seen "Wood," as he called himself, and had received the money, and that my mother might let him have the machine. My mother had some doubts about the telegram, but these were dispelled when "Wood" produced the guarantee which I had given him, and thus proved that he had seen me that morning, and she let him have the machine. This man is apparently going strong, and motor cyclists would do well to be on their guard.

T. A. DICKESON.

A HIGHLY DEVELOPED MOTOR BICYCLE.

Sir.—I have read the article (January 15th) describing Mr. H. P. Blake's design for a motor cycle de luxe with great interest. While his design has many good points and is well thought out, I think it is slightly too unconventional in appearance to appeal to the majority of riders. I consider the ideal motor cycle should be fairly conventional in appearance and designed purely for solo work, as the powerful sidecar combination de luxe must finally give place to the cycle car.

The machine_should be quiet, free from vibration and comfortable, and yet be capable of 45 m.p.h. on the level. My specification would include the following points:

FRAME PARTS.

Frame built of straight tubes throughout.

- Well sprung rear wheel (not a spring frame). Brampton front forks and ample mudguards front and rear.
 - Easily detachable wheels and big tyres.

5. Two good rear wheel brakes.

ENGINE AND TRANSMISSION. 1. H.O. twin engine of 34 h.p., placed across frames, detachable cylinder heads, and mechanical lubrication.
2. Multiple-plate clutch (hand and foot controlled), run-

ning in oil.

3. Four-speed gear box and enclosed shaft and worm drive to the back axle.

Accessories would include Lucas lighting set, good tool-hags, comfortable saddle, wide footboards, and leg shields. Screw-down greasers to be fitted to hubs and spring fork links.

A machine on these lines should satisfy the solo rider who requires speed and comfort, and who does not want a machine on conventional lines.

M. L. P. REILLY.

THE SPORTING SINGLE SPEEDER.

THE SPORTING SINGLE SPEEDER.

Sir,—I was much interested in "Revs's" letter in a recent issue, having had twenty years' experience of single-gear machines. I have no wish to own any other type.

On ordinary English roads the single-speeder is all that is required: even a Philipson pulley I find quite unnecessary, though it fulfils all its makers' claims. The existing prejudice against the ordinary T.T. model is due to the fact that it is designed on "hot-stuff" lines for competition purposes. The compression is too high, the engines too small and the ordinary media carburater manifolds. small, and the ordinary modern carburetter unsuitable. The rider soon tires of them; also, they are too noisy. In fact, there is no suitable type made, and I have to have

mine specially constructed to order in every case.

The first requisite is an oversize motor: 500 c.c. is not enough; for a single, 600-650 c.c. is about right. A twin should be V-type, not less than 700 c.c., preferably 1,000.
Direct belt-drive should be fitted.

The next is low compression. A spare set of shallow valve caps is most useful. The third is a decently designed

valve caps is most useful. The third is a decently designed carburetter. The fashionable single fixed jet, semi-automatic ones are hopeless. They give hard starting with a big jet, are heavy on petrol, and possess no flexibility. The carburetter must have a variable jet. Two of the B. and B. models, or the B.S.A., are good. For duffers, or for big twins, the pilot jet, B. and B., is the best. No attempt must be made to obtain high volumetric efficiency, but the whole designative weet two tractics were like the problements.

attempt must be made to obtain high volumetric efficiency, or the whole design is upset, nor to get very high speed. A machine on the above lines is fast enough (with decent driving it will do a genuine 8 m.p.h. up to 60-62 without tuning), and will climb normal hills with ease geared 4 to 44 to 1. It is tractable in traffic, and more economical than a two-stroke in petrol and oil. (I have regularly averaged 120-140 a gallon with two of my old machines, and they were not driven slowly. One was a 557 c.c., and the other 600.) Overhead valves are unnecessary and undesirable.

Further, there is no plug trouble.

Such a machine is as reliable as a clock, easy to start, and a joy to ride. Moreover, it is the last word in elimina-

and ergo ideal for the busy rider. The difficulties in I, and ergo tocal for the bissy rider. The dimenties in diling are exaggerated, in my opinion. I have taught old gentleman of 65, and several young girls, to drive a after ten minutes' tuition—none had ever driven a tor cycle before. Also, it is cheap to build—a vital at in these hard times—and the belt works under the condition. It is bind to turns when and continue the condition of the condit t conditions. It is kind to tyres, wheel, and engine

rings. he ordinary rider has never bestridden such; I doubt ch if "Ixion" or "Road Rider' ever has. If they they would not emit such fulsome praise on the multied, 300 lb., flat twin creations they affect. They are

come to inspect or try mine at any time.
he sidecar has spoilt the true motor cycle. I sincerely e the development of the cycle car will kill the overeloped, ponderous car on two wheels. AUTOBORE.

ondon, S.W.

ir.—I would like to answer your correspondent, T.P.," under the heading "Why?" in reference to ple single-speed machines. As an old motor cyclist, and ider of single-speed machines for about twelve years, I have a hankering after the old single-geared machine solo riding, and for the following reasons:

It is very light and easy to handle. Will climb any main road hill, and on a higher gear o than the modern three-speeders.

It is fast.

Very simple and easy to keep in running order.

Lower petrol consumption.

gainst this one has the disadvantages of traffic riding a high gear ratio, also riding in grease, and the inity to climb single figure gradients without shortening s belt and opening the pulley flanges.

good compromise is effected in the case of two machines, Rudge and the Zenith, where something of the simplicity he old single belt driven machine is retained, and a ratio low enough for almost any hill solo is obtainable,

the weight is not too much.
B.T.P." seems to be under seems to be under the impression that previous espondents were advocating the single-geared machine passenger work, which, of course, was not the case constant passenger work, with the modern coach-built car, let us have the three-speed chain-driven machine, all means, but nowadays the solo rider who wants a in hears, to some the two firms over 23 h.p., with the exception of the two firms ed above, and the T.T. single-geared Triumph. athersage.

CATION.

c,-There has recently been a lot of discussion as to the

of taxation for motor cars and cycles.

w, all motorists want roads, and, to my mind, should in proportion to the amount of damage they do to the

since, why not tax tyres? It would be quite easy to put tax on at the makers. And this would apportion the sion according to the use made of the vehicle. The r the tyre the heavier should be the tax.

H. W. HILLS.

,-I have read with much interest, the article in your e on taxation, and although I appreciate that this is ly your comment and has no connection with official s, seeing that the members of the Advisory Committee tless feel their way through literature such as this, I d like to make a few comments on the article in question give you another point of view of the subject.

st, it is rumoured that the Government intend to puish the 6d. tax on petrol. I think I am correct in g that most motorists have looked upon it as an estab-l fact that sooner or later this tax would be entirely shed. Now, however, the idea seems to be to knock off ad. tax merely in order to allow the oil magnates to clap nother 8d. or so for the benefit of their already good ends, so that the nett result of this little part of the action will be that motorists will have to pay 2d. more neir petrol. It makes little difference whether it is in orm of taxation or increased price, the fact remains that hall have to pay 3s. 2½d. per gallon if the rumoured ac comes into force. In the second place the Govern-, having taken off the tax of 6d., intend, presumably,

to add it to the Inland Revenue licence, so, therefore, supposing they merely add an additional sum based on a tax of 6d, per gallon it would mean that we should have to pay twice over. Whilst on this point I should like to say that I think the figure you mention in your article under the heading of "Effect of Compound Tax" is not at all a fair one.

I have a 34 h.p. sidecar outlit, weighing, I suppose, somewhere about 400 lb. According to your calculations, I should have to pay either £2 13s, or £3 10s,—t am not quite clear which—worked out on a basis of 5,000 miles per amum. 1, personally, do not reach anything like this figure, and I think if an average could be arrived at you would find that 2-3,000 miles per annum was nearer the mark. Myself, I reckon on 2,000 miles per annum, and with sidecar attached I can get 80 m.p.g. Under the present taxation, I have to pay £1, plus 6d, per gallon on, say, twenty-five gallons of petrol = 12s, 6d., but under the compound tax as above I feet the state of the state should have to pay £2 13s., and perhaps £3 10s., plus the 12s. 6d., which would be absorbed in the suggested increase in price of petrol, and doubtless there are thousands in the same position as myself.

The present system of taxation is, in my humble opinion, quite fair, and I will give you the basis of my argument. In the first place, the ultimate desire of any taxation is to recover compensation for the damage done to the roads. Now, when the 6d. is added to the petrol the system automatically collects from each individual motorist a sum in proportion to the amount of usage which he gives his machine, and, consequently, the amount of wear thrown upon the roads is also in proportion. Therefore, the petrol tax, if indeed an additional tax to that already paid for the Inland Revenue

licence is necessary, should stay as a fair and equitable one.

If the tax was placed upon vehicles according to the amount of damage they do motor cyclists would not be called upon to pay a single penny piece, as the Treasury coffers would be bulging out with the enormous revenue obtained from motor 'buses, lorries, and the like, which secm to be allowed about with their tyres worn to a mere shadow.

Another point is that during the war the majority of motor cyclists, owing to military duties, have been prevented from using their machines, and if not engaged on military duties the obstructive factor was the difficulty of obtaining petrol (except in a few cases where permits were granted), and the fact remains that they have been unable to use the roads, which have been absolutely broken up and spoilt by 'buses and lorries used on the public service for the benefit of the entire population. Now, however, that the roads need repairing the authorities are ever ready to seek out the unfortunate motor cyclist to pay the necessary amount to put right this accumulated damage caused at a time when he was absolutely debarred from using his machine upon the roads.

There are thousands of our best citizens on the road to-day who are running this beneficial pastime on very near lines, deriving pleasure and health, not only for themselves, but also for their wives and families, and I suppose the policy is to tax these out of existence for no other reason than that the tax is easy to collect. However, any such move will no doubt have the effect of killing the goose that lays the golden egg; but this would be no consolation to the motor cyclist who is absolutely frozen out. It is far better to prevent spilling the milk than to cry afterwards. P. SMITH.

An old tandem motor cycle, modernised by J. J. W. Pater, of Bedford, and still doing good service. The engine is an old pattern 23 h.p. Minerva, to which a magneto and B. and B. carburetter have been fitted.

Sir,—Apparently, no distinction is to be made between an 8 h.p. twin, eight or ten years old, used solo and singlegeared, and a 1920 8 h.p. sidecar combination, with three speeds, twice or three times as heavy as the old machine, and costing four or even five times as much. It is ridiculous to tax such utterly different machines on the same basis, and I should have thought it would have been obvious

basis, and I should have thought it would have been obvious to anyone with the vaguest idea of fair dealing.

Why would not a tax based on the original cost of motor cycles be the fairest and most satisfactory? Then the man who gave only £50 for a motor cycle would pay, say, 15s., and the man who could afford to spend £200 would pay 45s., if we reckon 10s. increased tax for every £50 increase in the original cost. In that way everyone would pay an amount recentient to his recens on the original cost. amount proportionate to his means, and the extent in which he indulges in motor cycling. I wonder such a proposal as this was not made long ago, as it seems fairer than any

Finally, with reference to the suggestion that a tax might be levied on the amount of petrol used in a year, I think 5,000 miles as the proposed average distance covered by motor cyclists is far too high. I do not see how a man who is at work all day long, and has only a few weeks holiday in the year, can possibly approach this distance. Personally, I consider I have had a fair year's riding if I do 2,000 miles and there must be a sure large number of months. miles, and there must be a very large number of men in a similar position to myself. London, N.W. EI

EIGHT YEAR OLD H.P. J.A.P.

AN IMPROVEMENT IN AIR-COOLING.

Sir,-With reference to "Rider's" suggestion in your last issue, for cooling the cylinder head on powerful two-strokes, "Rider" has totally enclosed the head of the cylinder except for the air inlet and outlet to the silencer. Would not this tend to overheat the rear portion of the cylinder head? The air, passing down the spiral course in the enclosed head, would be heated more and more, and would have little cooling effect. Would not flanges encircling the enclosed portion eliminate the overheating to a certain extent, if there is any? Enclosed is a sketch of a simple form of semi-enclosed cylinder head which can be easily attached.

A suggested method of aircooling by R. T. Halliwell.

WOMAN AND THE MOTOR CYCLE

Sir,-In The Motor Cycle of January 22nd, "Ixion" Sir,—In The motor Cycle of Bandary Lord, waxes eloquent on the question of knickers, or, more correctly, breeches, for lady motor cyclists. At the outset, and while trembling at my own temerity in opposing my opinion to that of such an august and eminent authority, I wish it to he_understood that I take an entirely different view.

Broadly speaking, there are two issues at stake. deal with the lesser of them first. I refer to utility. "Ixion" will surely agree that the ideal motor cycle for a lady must combine lightness with strength, hence the absolute necessity for a diamond frame. Given that a girl is riding a frame of this description, surely the breeches score points on comfort, warmth, and safety.

But these are secondary considerations, for the major issue is, like all questions concerning the eternal feminine, one of appearance. No girl should wear breeches who is under 5ft. 3in.; but the vast majority are of this stature or under 5tt. 5th.; but the vast majority are of this statute of above. This is the ideal wear for the average girl. Breeches of proofed cord, in khaki, green, or fawn, and cycling stockings, or alternatively high brown boots or puties.

These should be a three-quarter length, or preferably a

knee-length, coat of the same material, having "officer's" pockets and a turn-back collar, capable of being buttoned up round the neck. There should also be a belt of self material. Underneath the coat may be worn a woolly "jumper," or a shirt blouse, according to prevailing weather conditions. The fair rider may also have a bright coloured "Tam o' Shanter," or a storm cap of the same material as the suit, after the style of those worn by the R.A.F. girls.

A girl dressed after this fashion need not lose one iod of her femininity and charm. Picture to yourself a "jold good fellow," with sparkling eyes and wind blown hat burbling along on a fast T.T. Was ever fairer vision Surely a sight to make the pulse of even our sage an counsellor "Ixion" "rev." one beat faster.

And afterwards, in the coffee room of the hotel, let he appear in breeches, but without the coat, and the "jnmper appear in preecness, but without the cost, and the jumper replaced by a neat crépte de chine blouse of toning or contrasting shade, according to complexion, brunette or blond Then shall we worship from atar, and afterwards in the lounge she will hold her court. The perception of Britis sportsmen is not bounded by silk lace and frills, nor contrasting the production of t fined to the immediate vicinity of powder and pink ribbon.

PROVISIONAL PRICES AND DEPOSITS.

Sir,-How long are motor cyclists going to put up wit the one-sided system of provisional prices and deposits? Tal my own case. I made a special journey to Olympia, settle in my own mind what I thought would suit my requirement ni my own mind what I thought would suit my requirement viz., a runabout, and was assured by the representative charge that the price was pretty well fixed. I was prepare to place an order, but was told that I should have to but through an agent. As there are no agents in my own tow I must deal through one in a town ten miles away. We there ever such ridiculous nonsense? An agent in a town ten miles are to the subject of t ten miles away is of no more use to me than the makers ten mies away is of no more use to me unan the makers hundred miles away. Anyway, there it was; take it leave it. So I wrote to the agents, and received a letter saying I could have delivery in June if I booked at one which I did by wire. A week after I received a letter say that, owing to the national increase of 5s. a week. wages, my runabout would cost me £50 more. Thus, if I as an engineer and get 5s. advance it will take 200 weeks of to pay this increase in price.

Now the makers already knew that this increase was du Now the makers already knew that this increase was due as it had been awarded a month before. Why could the not have fixed this later price for the Show? Possibly the got more orders than they expected. On top of this I a asked to pay a deposit of one-third of the price, and sign agreement to the effect that they may cancel the ordered and return the deposit, but whatever the price the maker. fix, or whatever way the makers alter their specification, may not cancel the order without losing the deposit

Now why should I and others provide one-third of th agent's capital for six or seven months without having son share of the profits? This sort of thing is going to be permanent unless we make a stand against it.

Patriotism does not mean allowing makers and agents diddle us. I know times are a bit unsettled, but they a settling down very quickly. I notice one or two makes have withdrawn the selling price from their advertisement and instead refer to the price the machines are fetchin price? To prospective buyers I would say hold your breat a bit. Do not get tumbling over one another to leave on a bit. Bo not get unimn goth one anotate reast of third deposit with any firm without a good security for i when by waiting a little, without getting excited, you wis soon be able to pick and choose, pay the money down, an take the article away. A lot of us have gone without motor and a little leave will not reast the article away. for three or four years, and a little longer will not matte. Bolton

BOOKS AND MAPS FOR MOTOR CYCLISTS

TRACING MOTOR CYCLE TROUBLES."

A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.

Edition

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd. 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents ore urged to write clearly, and no non eside of the paper only, numbering each query separately, and keeping a copy for case of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Disc Wheels.

I should be much obliged if you would give me your experiences with disc wheels on a 5 h.p. twin, for solo touring.—G.F.E.W.

I member of our staff, who has been unning disc wheels on a 5-6 h.p. anchine, finds no difficulty or trouble tending their use when riding solome of our correspondents, however, laim that in strong winds there is a officeable effect on the steering. It rould appear, therefore, that the effect f wheel discs depends largely upon the articular type of machine, and also, ossibly, upon the rider himself.

Hints to a Novice.

I have recently purchased a continuous process. I had a few minutes in trying to get it to run, without success. Will you please tell me which is the easiest way to get a two-stroke in motion? The machine has an Abloin two-speed gear, B. and B. carburetter, and C.A.V. magneto. Is the machine

in low gear when the lever is pushed forward, or the reverse?—H.T.
The machine in question should be reliable. Flood the carburetter; engage the low gear, release the compression, and push, letting go the compression release

lever as soon as a fair speed has been attained. The engine should then start. You can easily tell which is the low gear by seeing which offers the greatest resistance when you raise the compression release and push the machine forward. The greatest resistance, of course, is felt when the machine is in low gear, owing to the greater engine speed.

Silencer or Long Exhaust?

I should be obliged if you would kindly tell me if a long exhaust pipe, about 2in. diameter, and about 4ft. long, without a silencer, complies with the regulations?—R.W.J.

An exhaust pipe, without an expansion chamber, does not comply with the letter of the law, although, if the machine is reasonably silent, it is not likely that any action will be taken against you.

Too Large a Jet.

I am unable to open fully the throttle, so I should be obliged if you would kindly give me your opinion as to the cause of a very limited range of control.

I am only able to advance and retard the lever about one inch. Is the jet too small in the Amac carburetter on my 3 h.p. Royal Enfield?—M.M.

The trouble to which you refer is probably due to too small or too large a jet, which latter would cause the engine to choke. Examine the plugs; if these are covered with black soot, which easily rubs off, the indication is that the mixture is too rich.

This type of sidecar has the decided advantage of being completely weather and draught proof when the hood and screen are in position, yet when desired full advantage can be taken of fine weather. The outfit was supplied by Mr. E. W. Ball, the Scott agent, Birmingham, to the order of Mr. G. L. Bowley, London.

MOTOR (YCLE

A Fierce Brake.

When applying the internal expanding toot brake of my 7 h.p. Indian a horrible squeak occurs. The brake is very-efficient, doing its work thoroughly, and, of course, application of oil might stop the noise, but would make the This trouble is very brake useless.

annoying. I have a smart mount, and this hideous noise is not pleasant when pulling up .- F.M. We should recommend you to try

putting a drop of oil on the brake; if you do not overdo it you will-not seriously interfere with the stopping powers of the brake.

A Hub Clutch.

My machine is a 1913 6 h.p. Zenith, multiple disc clutch in rear hub. How is the clutch adjusted? How far should the operating rod protrude from the worm on the axle? The number of degrees that the actuating arm and cap should revolve when the clutch is thrown out by depressing the pedal?-J.R.R.S.

The operating rod on the 1913 Zenith rear wheel clutch should not require more than about in. of movement, and the operating arm on the hub spindle should move about 45° completely to effect disengagement. From the sketch you submit, apparently no adjust-ment is provided, but the makers of the clutch would give you fuller information on this point.

Tuning Old Machine.

I have recently taken down my 3½ h.p. Indian engine for decarbonisation and fitting new inlet and exhaust valves and springs, also new exhaust valve guide and piston rings. I have a B. and B. carburetter which had a 48 jet, and the taper needle used to fit right down into the top of it, closing it entirely. Now I have fitted a 45 jet and the taper needle cannot close the hole at the top of the jet. The difference on the road is that the air lever has to be absolutely fully open, whereas before I could not open it more than in. past the throttle lever. It more than ain, past the through ever.

(1.) Would this mean that the 45 jet is bigger than the 48 jet, or that the extra air is the outcome of the work I have done as above? (2.) How to determine the petrol level and to get it correct, as the new float shappen. I have fitted as the new float chamber I have fitted to my 1914 B. and B. is off a 1918 model, and the level has been tampered (3.) My engine fires well, but every time the platinum points part I find that they leave a space of about The in instead of the usual visiting card. Should this be adjusted? (4.) This is a countershaft clutch model. Could I have fitted a back wheel hub, threespeed gear, or any other sort of speed gear? I do not use a sidecar. Chain drive throughout. (5.) Taking full air as my B. and B. pilot jet carburetter does, which is the best position of the levers; also the ignition to start up from cold ?-A.E.K.

(1.) Marked jet sizes are not always accurate, and this may account for your difficulty. Also the new jet may not be quite so high as the old one; this would also have the same effect. (2.) The petrol level should be about 32in. below the level of the top of the jet. (3.) 16in. is rather excessive, and the contacts should be adjusted to about $\frac{1}{64}$ in. (4.) It would be almost impossible to fit a three-speed hub to the single-speed Indian. Possibly the makers can suggest some suitable fitting of countershaft gear. (5.) When starting, the air lever should be closed, the throttle about one-quarter open, and the ignition fully, or almost fully,

Long or Short Wheelbase?

Is a short wheelbase 3½ h.p. machines preferable to the long one? If so, why do the manufacturers neglect this?

general comfort the short wheel-For base is not very satisfactory; it is only used on T.T. models to facilitate cornering at speed.

Angle of V Twin.

I had the magneto stolen from my 5-6 h.p. twin, and I bought another, but the degrees are wrong. Can you tell me how I can find the correct angle? The timing is by the eccentric lever. If I cannot refit this to another magneto, will you tell me the right size gear

wheels to get?—W.R.P.

The angle of a V twin engine is that between the centre lines of the two cylinders. This you will have to measure actually on your own engine, possibly by carefully taking external measurements and making a scale drawing. The space between the two cams in the contact between the two cams in the contact breaker will be 180° plus half the angle of the cylinders. We do not understand your statement respecting the timing being by eccentric lever. The gear ratio between the engine-shaft and the magneto spindle is 2 to 1-that is, the magneto should run at half the engine speed.

EXPERIENCES WANTED.

"T.D.F." (Huddersfield).—General experiences of 7-9 h.p. Indian, electrically equipped model, also Scott.

RECOMMENDED ROUTES.

SOUTHAMPTON TO EXETER .-- E.H.

Southampton, Cadnum, Ringwood, Wimborne Minster, Bere Regis, Dorchester, Bridport, Axminster, Honiton, Exeter.

DUNSTABLE TO REIGATE .-- W. F.D.

Dunstable, Tring, Chesham, Beaconsfield, Slough, Windsor, Egham, Cobham, Leatherhead, Reigate.

REDDITCH TO SWANSEA.—J.B.P.
Redditch, Droitwich, Worcester, Great
Malvern, Ledbury, Ross. Monmouth, Usk,
Newport, Cardiff, Cowbridge, Bridgend,
Neath, Swansea. Approximately 135 miles.

LIVERPOOL TO EXETER.-H.H.

Liverpool, Birkenhead, Chester, Whitchurch, Hodnet, weining..., Bridgnorth, Kidderminster, Worcester, Cloucester, Quedgeley, church, Hodnet, Wellington, Ironbridge, Worcester, Tewkesbury, Gloucester, Quedgeley, Alverston, Bristol, Bedminster, Red Hill, Churchill, High bridge, Bridgwater, Taunton, Wellington, Cullompton, Exeter.

Triplex Glass.

We understand that Triplex safety glass has been standardised in the windscreens fitted to Montgomery sidecars.

Rotax Accessories in Manchester.

The Rotax Motor Accessories Co., Ltd., opened last month their northern depôt at 291, Deansgate, Manchester. The Regent Motor Cycle.

In our description of the Regent motor cycle we referred to the Coventry Victor specialities as forming part of its specification. We understand that the frame, although closely resembling the Coventry Victor design, is not exactly the same, every lug bolt being interchangeable.

Tyre Firm's Success.

At the Glasgow Housing and Health Exhibition, Mend-a-Tear process, for mending rents in clothing, to which we have previously referred in our columns, and which is sold by the Leicester Rubber Co., Ltd., Post Office Place, Leicester, was awarded a first-class diploma for excellence.

Bradford Carburetter.

The carburetter described recently is, we are informed, fully covered by Patent No. 27,060, 1919. New instruments cannot be supplied until the effects of the moulders' strike have subsided, but a limited number of old pattern Amas can be converted.

Magneto Contacts.

When platinum and iridium were Gov-ernment controlled the price rose from ernment controlled the price rose from £24 to £26 per ounce, and now that the control has been removed the price has risen to over £51 per ounce. We have control has been removed the price has risen to over £51 per ounce. We have known the firm of J. Edwards Brown, 38, Herbert Road, Plumstead, London, S.E.18, makers of Jebron contacts (which contain the above metals), for over fifteen and it is with great correct that years, and it is with great regret that they ask us to announce that their prices have had to be advanced in consequence of this rise in the cost of the metals in question.

The Price of Benzole.

As announced last week, the National Benzole Co. have raised the price of benzole as from Monday, January 26th, by 4d. per gallon, making the retail price in England 3s. 1d. per gallon in tins, instead

of 2s. 9d. as previously.

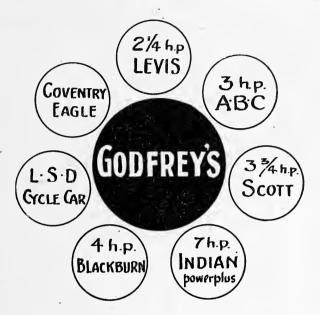

The increased costs of material and labour are advanced as the reason for this rise in price. These costs are stated to be more than three times greater now the three size of the costs are stated to be more than three times greater now that the cost of th than they were in 1914, and have resulted in many instances in a loss to the producers. Another factor which affects the costs of distribution is the 60% increase in railway rates.

In ratiway rates. No further increase is anticipated, unless the cost of production again rise. The National Benzole Co. do not intend to vary the price of benzole in accordance with that of other fuels.

Surrounded by Good Things.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.
ADVERTISEMENTS in these columns
-First 12 words 3/-, and 3d for every ad-Paragraphs of under 8 words ditional word. Paragraphs of under are charged double rate, i.e., 6/-. paragraph is charged separately. Name and aldress must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this -section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of Issue.

All letters relating to advertisements should quote the number which each advertisement, and the date of the issue

in which it appeared. The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which, must include the words Box ooe, 60 "The Motor Cycle," Only the number will appear in the advertisement. All replies should be enddressed No. ooe, 60 "Motor Cycle," 20, Twdo Struck, E.C.4. Replies to Box Number advertisements containing remillances should be sently by registered post, but in all since cases it is advisable to make use of the Deposit System.

cases it is advisable to make tise of the Deposit System. In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without its being inspected by the intending purchaser, advertisers will accilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our may deal in perfect safety by availing themselves of our many deal in perfect safety by availing themselves of our safety of the safety of the

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

THANK

their numerous customers for the consideration and indulgence extended to them during the difficult period of removal from LONDON to New Offices, Warehouse, and Works at CROYDON.

Delays have unavoidably occurred during the past two weeks occupied in removal, but increased staff facilities and better working conditions will ensure the utmost promptitude and attention to all enquiries and orders, in as far as the unsettled conditions existing in the labour and raw material markets will permit.

As soon as the Works are in full swing it is hoped that Stocks will be increased to such an extent that deliveries can always be made immediately on receipt of order.

Many new lines are in course of production, and customers should therefore ask for their name to be added to the mailing list for new catalogues as issued.

OUR AIMS ARE

BEST QUALITY AND DESIGN. INCREASED PRODUCTION. PROMPT DELIVERIES. NO COMPLAINTS.

Will all Customers kindly note CHANGE OF ADDRESS.

In the "News and Leader," May 28, 1915,

"KUKLOS" related how he obtained his new machine

JULIAN'S OF READING

At first I expected to find my choice a matter of embarras de richesse, but a weck of inquiry left me wondering if I had not purted with the light car carelossly. The iremendous extent to winch the makers of all motors, big and little, are involved in the war was brought right home, and I was after a big twin of 900 to I,000 cc, with three-sp-ed countershaft gear box, and either all-chain drive or chain-cum-bett. The 1-9 hp. Matchess was one of my earliest fancies until I heard that the Plaunstead firm wanted three mouths for new orders. I wrote my old friends, Pheion and Advanced the control of the

Before 4 o'clock I was oft back on the road with the new outfit, and home before 8 o'clock. We live in times of unceremonious haste, but I fancy I have got the pick of the basket.

You may also be lucky if you write at once.

Petrol at Three and Tenpence.

N addition of nine and a half pence to the price of petrol, combined with the certainty of increased taxation when the Budget comes along, is a serious setback to a large number of motor cyclists. So serious is the position that we feel it must undoubtedly have an adverse effect on the motor cycle industry. It is true that, in all probability, the petrol tax of sixpence per gallon will shortly be removed, but if that tax goes the increase in the flat rate of motor cycle taxation will more than counterbalance this slight relief, and the remaining three and a half pence will prove the last straw to a number of owners and prospective owners. The industry has not had a chance of recovering from the effects of war. It was hard hit by the moulders' strike, and this additional blow is unjust to a young and growing industry. Clearly, any decline in the sale of machines is bound to lead to further unemployment, which is distinctly against national interests. cannot help feeling that the Government is largely responsible for this grave state of affairs. Nothing seems to have been done to check the petrol ring, and nothing to develop a homeproduced fuel.

New Legislation Wanted.

Regarding the new taxation, we emphatically protest against any considerable increase in the taxation of a type of vehicle which occasions little or no damage to the road, and is undoubtedly the poor man's automobile.

The price of fuel, however, is a different matter, and we feel that the Government is sadly to blame in allowing a key industry, such as the motor industry has proved itself, to be almost at the mercy of the petrol ring.

We repeat that this country can produce the whole amount of fuel required for mechanical transport, and is only restrained from so doing by effete legislation. The obvious solution is a mixture of benzole and alcohol. The former

is already available in fairly large quantities, and the output could be increased considerably given suitable encouragement. Alcohol could easily be produced in almost unlimited quantities were it not restrained by legislation. A home-produced fuel would tend to reduce our imports, and thereby assist our exchange; it would provide employment for a mass of labour; and would have a very beneficial effect on the motoring movement by lowering the price of the most vital necessity. What is hindering the Government in encouraging the production of alcohol? Is it the fear of increased inebriation? If so, it should be a simple matter to prevent the sale of power alcohol otherwise than in a form suitable for power purposes (e.g., mixed with benzole), which would be sufficiently unpleasant to discourage any but the most determined drinker.

Protection has been Earned.

The war proved conclusively that the motor industry is a key industry. It made possible the enormous and vital transport services, aviation, tanks, and other kindred branches, and yet it is rewarded by increased taxation and an entire lack of protection. It attained its present importance in face of repressive legislation, though the Government was glad to employ its services to the fullest advantage during the war. Why, therefore, is the opportunity to repay the industry to some extent ignored? Did not the war prove that the motor industry was a national asset?

Our needs in war time were demonstrated with sufficient clearness to leave no excuse for further blundering into repressive legislation. The protection and encouragement extended to the magneto industry should at least be extended to the motor industry as a whole, firstly, by ensuring supplies of Government fuel at a reasonable charge, the profits to go into the National Exchequer to assist in road development; and, secondly, by reasonable taxation, which will not prove a burden and hinder the growth of a young and important industry.

The Lagonda Tricar.

THE other week I remarked that I did not know why the Lagonda tricar disappeared from the market. One of the principal exponents informs me that he gave it up for two main reasons, viz., the accumulator ignition and the automatic inlet valve. He owned a final model equipped with magneto ignition, but it was practically impossible to obtain a handle start with this ignition. He adds that the water-cooling was none too well carried out. Other correspondents confirm my suggestion that there was nothing the matter with the tricar principle, and that if modernised outfits on similar lines were well made, they would give the average sidecar something to think about.

Detachable Cylinder Heads.

TR. A. M. HICKS alluded the other week in interesting fashion to the difficulty of maintaining a gastight joint between the cylinder and its detachable head. That the job is by no means impossible is proved by the number of car engines now equipped with the "loose head." Of course, this joint is infinitely more complex with a water-cooled four-cylinder monobloc than on any motor bicycle engine. On the other hand, the reality of the difficulty is shown by the readiness with which a single valve cap will leak. The exhaust cap on one of my engines is leaking at this moment, although it has a deep, tight-fitting thread, is anointed with Rotary jointing paste, and was clumped well home with a long spanner and a mallet. Mr. Hicks suggests anointing the copper asbestos washer with engine oil, on the ground that the oil will carbonise when the engine is run, and so seal the joint. The notion is not absolutely sound. If the C.A. washer is soft, it will shrivel when it is heated, and the pressure may blow out the carbon; if the C.A. washer is old and hard when the joint is made, there will be leaks at first fitting, and the oil will possibly be blown out before it has time to get carbonised.

The Causes of Leaks at a Detachable Head.

S detachable heads are far commoner than they used to be, it is worth noting the causes of leaks and the appropriate treatment. Leaks may arise from—

(1.) Untrue surfaces.

(2.) Distortion of parts, due to uneven cooling.

(3.) Nuts not being tight.(4.) Dirt between the surfaces.

(4.) Dirt between the surfaces (5.) Shrivelled gaskets.

The last three causes are within the control of any amateur tinkerer, and are easily dealt with. The first two demand rather closer attention. In ninetynine cases out of one hundred the faces of the joint are probably true when a new engine is delivered to A30

a user, but if leaks persist, the faces should be tested, and, if necessary, ground true, which is not a job for a novice. Whether faces which are originally true will remain true throughout a season depends on the designer of the machine. If an engine has a very narrow safety margin in respect of cooling, and is maltreated on the road, either the head or the barrel may distort permanently to a degree which will spoil the gas-tight joint; in this case regrinding is necessary. There may be engines which distort when fully heated, and shrink true again as they cool; but I have never struck a sample of the breed. So far as my experience goes, it is always possible to get a gas-tight joint with the engine cold.

Remaking a Cylinder Head Joint.

S these joints have been comparatively rare for many years on motor cycle engines, readers may be interested in the standard method of refitting the far more complex joints on car engines, such as the Ford, Maxwell, Morris-Cowley, etc. The procedure is as follows:

(1.) Make the metal faces scrupulously clean.
(2.) Examine the old gasket, after cleaning it thoroughly. Reject it if damaged in any way, e.g., copper buckled, asbestos packing lumpy or detached, etc.

(3.) Smear both sides of gasket with goldsize.

(4.) Tighten nuts a turn at a time in rotation (central nuts, if any, first).
(5.) Run the engine for a minute, and apply

spanner again.

(6.) Give the engine a short trip on the road, avoiding full throttle, and tighten nuts again.

When a washer is used at the joint, it is always wise to have a spare washer at hand before breaking the joint, though old washers may be utilised repeatedly if they are carefully handled.

Dissolved Acetylene.

RETURN to this subject because various letters received show considerable interest in my opinions about this illuminant, especially with regard to its absolute reliability in competition work, and particularly in twenty-four hour trials. The general consensus appears to be that its comparative unpopularity in England (as opposed to the United States, where for years past it has been the motor cyclist's standby) is due to: (1.) Scarcity of exchange depots (for obtaining new cylinder). '(2.) High price (the outfit, minus lamps, costs about \pounds ,5). (3.) Sale of short, fat cylinders, whereas long, thin cylinders are desirable for use on motor cycles. I admit the indictment. In fact, I referred to the subject because such lighting still has a potential future upon motor cycles when the necessary remedies are applied.

An Object Lesson in Freak Hill-climbing.

Correct and Incorrect Methods of Negotiating Abnormal Surfaces and Gradients.

HILL.

WORCESTER-SHIRE.

I a recent week-end trial, in which the competitors were all employees of the James Cycle Co., Ltd., a rather amazing variation of performance was observed on one of the test hills included.

With one or two exceptions, the entrants, despite their

trade connection, were pure amateurs as far as motor cycle competition riding is concerned, and, being mostly mounted on identical 5-6 h.p. sidecar outfits, comparison of their

methods was interesting. The hill concerned was one of some severity, with a very loose and moist surface, and we have seen from time to time the most expert competition drivers fail to persuade a sidecar over the worst part, hence failure thereon is no disgrace.

thereon is no disgrace.

The majority failed through whee slip, resulting from rushing tactics. One or two old hands climbed steadily, avoiding the loose crown of the road and selecting firmer ground at the side. The engine must be kept turning over at a moderate rate, well within its power. Undue acceleration and konking are alike to be avoided.

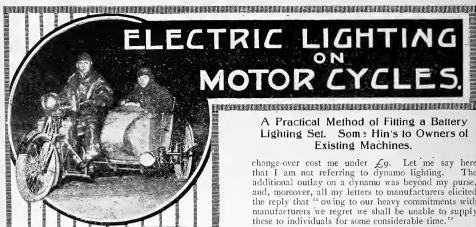

Solo failures mostly resulted from too great a speed. The old hands climbed steadily and slowly, wrists braced, feet on footboards, and eyes selecting the firm places. Main road riders see the hill and loose stones, dash forward, fling out the feet, give a spectacular display, and then subside—the old tortoise and hare story!

The passenger endeavours to prevent wheel slip.

A lightweight owner runs alongside.

Wheel grip is the deciding factor on freak hills.

T must be quite obvious to all who are interested in motor cycling that electric lighting is at last coming into its own. While this must be a matter of great gratification to those fortunate individuals who are shortly to become possessors of new machines fitted with this "luxury," it is apparently only of passing interest to those motor cyclists who have already invested in their post-war machines, and who regard the fitting of electric lighting as being too difficult and expensive a matter to warrant their consideration. The object of this article is to lay my own experiences in electric light installation before those who, like myself, have wearied of messing with carbide and jugs of water on a dark night, and to whom the anticipatory joys of "waiting for the smell" make no appeal.

Moderate Cost.

Some people seem to have the happy knack of being able to get 100% efficiency out of acetylene lamps; they can ride ten miles to town, spend three or four hours shopping, and they can leave their lights unattended for half an hour at a time outside shops, and then ride ten miles back in a high wind over a bumpy road, and arrive preceded by a 1,000ft. beam and with the rear light going strong. I am not one of these. It is only a few weeks since I last fumbled for my licence under the suspicious gaze of a constable at about ten o'clock on a wet night, and as I pushed my heavy machine out of his sight, with but the faintest glimmer of a blue bead in the head lamp, I swore a mighty oath. I have now fulfilled it, and have but to turn a switch before leaving the garage to get ample illumination under most economical conditions, and without covering myself with carbide and the tank with water.

To take the question of expense first, this naturally varies for different requirements and different types, but, broadly speaking, from £7 to £10 will equip a combination with a thoroughly efficient lighting equipment, and naturally, anything that can be raised on the old acetylene lamps reduces the outlay.

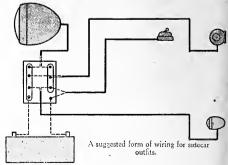

A Practical Method of Fitting a Battery Lighting Set. Some Hin's to Owners of Existing Machines.

change-over cost me under £,9. Let me say here that I am not referring to dynamo lighting. additional outlay on a dynamo was beyond my purse, and, moreover, all my letters to manufacturers elicited the reply that "owing to our heavy commitments with manufacturers we regret we shall be unable to supply these to individuals for some considerable time."

Battery or Generator?

Now a few words as to the selection of the outfit. The first question is "Accumulators or dry batteries?" My advice as regards this is that, considering the state of our roads at the present time, solo riders will get equal satisfaction with less trouble by using dry batteries. A pair of these, costing about 10/6 each, and used at alternative intervals, will last a most surprising time. I used a pair alternately in the above manner for over three months of heavy riding, and could detect no falling off in the light whatsoever at the end of this time. For sidecar outfits I unhesitatingly recommend an accumulator. These will light three lamps for ten hours or so continuously, and can be recharged in the home or elsewhere at a trifling cost. It is also an easy matter to carry a dry battery on the carrier or footboard, to use when riding without the sidecar and as a spare in case of emergencies.

There are other methods still of obtaining current, two of the most well-known being a machine of the "Voltalite" type, and a conversion set to enable the primary current of the magneto to be utilised. With both of these, however, it is necessary to have a battery to provide light while standing. The latter system, moreover, needs a battery for slow speed work, as the

etric Lighting on Motor Cycles .-

agneto current is all required to produce a good ark under these conditions.

Now as regards the type of light to select. I wish warn motor cyclists from investing in an "earth urn" or "single contact type" of lighting set, out from the fact that these sets usually necessitate a scraping of a bright patch on the frame under a switch, and the scraping, in a similar manner, of at portion of the carrier which is to hold the rear tht, the danger of an undetectable leak through ulty insulation is always present. This might well haust and even damage the accumulator, and might to trouble on a very wet night. The best possible

be of lamp set to get is it which is worked on the louble contact?' prinde, as in ordinary house

hting.
Another small, but imtrant, point is that ternals on lamps are, to
the least of them, uniable methods of attachnt. They may get wet
1 "short circuit," or
may become unserswed

ough vibration and drop

The best lamps have conet sockets, into which miniature edition of the linary household adaptits. Choose also a td lamp from which the be and holder may be dily removed while ght. An inspection lamp this sort is a great boon the event of trouble on road at night. As re-

ds wire, the usual twin-coloured "flex," though istic, is hardly strong enough in the insulation to its much of the inevitable chafing which it will fer; its insulation is not absolutely weatherproof, I it soon loses its colour. "A good stout single cable, h as "workshop flex," with two wires inside, is ferable, and will last for years without attention.

Four or Six Volts?

Switches of various types are on the market, some them most ingenious creations of nickel and ebonite, igned to go on to the handle-bar. They are, as rule, expensive, are not always weatherproof, I sometimes must be carefully insulated from the portion of the frame to which they are attached in my faith to the ordinary percelain-based tumbler the, which is best attached to the top tube on all wooden block. It can then have a sort of inled sponge-bag arrangement made out of a piece oilsifik, laced oyer it. The switch is quite water-of, can be worked through the folds of the bag, I, last but not least, children playing in the street, ugh they may squeeze your horn, will not waste ur precious "amps" by switching on your lights, the switch is most effectively hidden.

Before going on to describe the fitting of the lights, ew words would not be out of place as to the voltage at which to run the system. The choice usually lies between four and six volts. I myself choose the latter, which gives a slightly stronger light at the cost of an hour or two cell capacity. It is well to bear in mind when making this decision that most motor cycle dynamos are constructed for this voltage. If you contemplate getting a dynamo in the future, it would be advisable to pay the small extra sum usually charged for a six-volt accumulator and lamps in lieu of a four-volt, as neither the bulbs nor the accumulator will have to be replaced.

Now I will assume that the box containing your electric lighting set has arrived, and lies before you. Unpack it carefully, sifting the straw packing

thoroughly for loose bolts, terminals, and other odds and ends. Bring out the wooden box containing the accumulator, and carefully remove the accumulator from the inside. Take this off at once for its initial charge, usually at least twenty-four hours, so that it will be ready for you when you have completed the wiring-up process. The object in leaving the box behind is to help you to choose a suitable resting place for it in the body of the sidecar, and to have it ready secured there by the time the accumulator is charged. Do not be tempted to utilise locker mulator, which is about

the time the accumulator is charged. Do not be tempted to utilise locker space, which is usually covered with oilskin.

The property of the electric bulb, the type to prove the time the space, which is usually covered with oilskin.

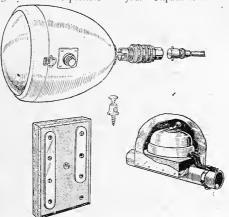

The proventy of the time the accumulator, which is about in a foot forward of it. The box should be bedded level on the floor with a block of wood at one end if necessary, and should be turned with the hinges away from the side. If placed the other way, it cannot be opened owing to the fall back of the lid. Secure the box in position with two bolts passed through the wood and the side of the sidecar. The inside heads should be slotted and countersunk so as to be clear of the side of the accumulator. After cutting out a small section of the side of the lid (to allow it to close on the wire) the box can be bolted in position

Mounting the Lamps.

the sidecar body.

and secured with a nut and washer on the outside of

The lamps, which are supplied with usual clips, etc., should now be fitted. This requires no explanation. A tip which I can give, however, is to place insulating tape or soft packing of some sort under the clips on the handle-bars, carrier, and sidecar lamp fitting. This eliminates any slip, insulates the lamp from the machine in the event of an earth, and also has an insulating effect from road shocks to the lamp filaments. Fit lamps, where possible, on a sprung portion of the frame or chassis. Now obtain a block

(Top) Showing the bayonet fixing for the electric bulb, the type recommended by the writer. (Left) Junction board fitted in the sidecar. (Right) Top tube switch covered with oilskin.

Electric Lighting on Motor Cycles .-

of wood for the switch, square if possible, drill it for wires and screws, and hollow out base so as to seat it on the top tube. It should be secured by a broad metal band passed under and around the tube, and with two small nuts and bolts. Place it well clear of filler caps, gear change levers, and clear of the bounce of the saddle. Now procure a ready-made wooden block, such as is commonly sold as a base for an electric light switch or a wall gas bracket. Drill a hole in the centre to take a 1 in. bolt. Procure eight brass terminals with wood screw stems. These can be bought for about twopence or threepence each, and should be screwed into the block in rows of four, one row on each side of the central hole. The left-hand row should be bedded down on to a strip of thin metal (to connect all four together electrically), and the top three of the other four should be bedded on to a similar, but naturally shorter, strip.

An Accessible Junction Board.

After making sure that the points of the screws do not project through the wood and touch the sidecar body, the block can be bolted up through the side of the body and four or five inchés above the battery. Three holes for the wire must now be drilled through the side of the sidecar, and should have ferrules opened out in them to prevent the wire chafing.

All that now remains is to run the wires. Run one double wire from each lamp to a pair of terminals (one on each strip) on the board. For the sake of

simplicity, I suggest the top pair for the head lap, the next for the rear, and the third for the sid a lamp. Then if any lamp gives trouble its own nections may instantly be inspected. The bottom if of terminals should be connected to the terminal of the accumulator, the last connection of all being he joining of the bottom terminal of the short strike the isolated terminal below it (which already can be battery connection) through the switch.

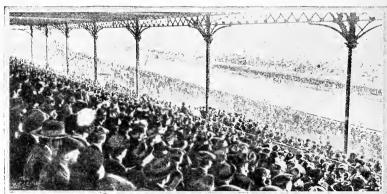

To Safeguard the Battery.

The switch will now be found to control all talights. There is no possibility of battery lead through a defective lamp, since the breaking of switch completely isolates the battery, and, lastly have are neatly arranged with no forked ends, are therefore quite weatherproof.

I have purposely omitted all mention of the lad of the wires from the lamps to the board, as in must necessarily vary for all different machines. A property of the movement of the forks in the head lamp and remember the inspection lamp—you may to use it—also allow for the spring of the sic are body. Clip the wires at intervals with Bowden and you will never have any wiring troubles.

In conclusion, for purposes of current econon recommend the fitting of a higher voltage bulb it rear light; it gives a slightly dimmer light but a lot of "juice." I use an eight-volt bulb in my a light, and it gives quite a good light on six volts.

WD

AMERICAN RAC:

A crowd of 25 people gathered for motor cycle racing Ascot, Los Angeles, month, the largest cro it is stated, that witnessed a motor c race. The great con was between Har Davidson and Inc machines for the hundred miles A: championship, when former gained the vict in 1h. 17m. 42s., average of 771 m.p.l

NICE-LA TURBIE HILL-CLIMB.

THE Moto Club de Nice will hold the above climb on February 19th over a distance of about five miles, the average gradient being r in 14. There will be three classes. Class A, motor bicycles; B, sidecars; and C, cycle cars.

The prizes include a bronze trophy, held since 1912 by the M.C. de Nice, to be competed for by club teams. The Martini trophy is another award for club team competitors

Classification for both trophies will be by the posgained by the first three team members for the co trophy and the first two team members for the lattini trophy.

Entrance fees—motor bicycles, 50 francs; decars, 60 francs; cycle cars, 75 francs—should rich the hon. secretary M.C. de Nice, Monsieur Estat, 39, Avenue de la Victoire, Nice, on or bore February 17th. at 10 p.m.

A City Motor Cyclist's Impressions

THE opinion expressed by the motor cycling public with reference to the general utility of the motor scooter is usually of a vague and puiring nature-a misunderstanding which is, of irse, emphasised by the fact that there still remains great deal of prejudice against this "expensive - and the new public, although interested in the relty, have been unable to experience the joys ociated with its use, as the supply of machines mavoidably curtailed. The use of the motor scooter the limited purposes of the country postman, the ortsman, and the like have been previously criticised, an experiment with one of these vehicles for use large towns and cities, where the congested traffic I greasy roads present great difficulties to the twoseled rider in maintaining his equilibrium, has ealed the practicability of a motor scooter.

member of Motor Cycle recently tried of these maes in the heart London traffic, his impressions probably idenwith any cyclist notor cyclist who not ridden such machine under conditions se ore.

rior to the run, burden of a fear arent, and it out-

lined a vision of enormous motor lorries, 'buses, and waggons. Regardless of the little scooter on the road, they appeared to loom in the distance, only awaiting an opportunity to leap upon the impudent machine which dared to take a place on their privileged route. In practice, however, this impression was quickly removed, and the rider soon discovered that an entirely opposite situation existed. A feeling of growing confidence could be felt as the heavier vehicles, which hitherto monopolised the road, were rapidly passed. Drivers glanced with scorn at the little machine coming along the road and gradually creeping to the front of the column. Amusement could be seen on the faces of the interested crowd who had assembled to witness the over-handicapped Nothing could restrain the progress of the scooter until, having arrived at an open space in

front of the vehicles. touch of the throttle caused the machine to forward and continue a non-stop journey through the heart of the City of London. It was amusing and gratifying to notice the courtesv shown by the drivers of the heavier vehicles as the machine sped by. This was also noticeable at most of the big traffic

The Scooter as a Utility Machine .-

centres. The police, probably realising the nimbleness

of the scooter, gave privilege of passage.

It is possible to classify the advantages observed when using the scooter for the purposes outlined in this article. First, one of the most important factors essential for its general use is the ability to place the machine in safe custody at the termination of a journey without the time-wasting difficulty of locating a garage or other shelter. The scooter, weighing just over 100 lb., can be carried if necessary into the porch of the office or building and left without fear of theft or infringement of the law until it is required again. Secondly, journeys from door to door can be made at an average speed greater than that of public vehicles plying for hire, with greater comfort and at a minimum cost. Should the machine at any time sustain a breakage from which, throughout the writer's experience, it seems to be immune, the smallest corner of any neighbouring building can accommodate it until the rider deems it necessary to repair the defect. Of course the A.B.C. machine under discussion is in effect a miniature motor bicycle suitable for a lady or gentleman. Its open frame enables a heavy coat to be worn in wintry weather. With an engine of 60 x 44 mm. = 125 c.c. bore and stroke and rated at 11/2 h.p. it is naturally low geared, but the little engine does no seem to mind such a low ratio and keeps cool unde: all normal conditions.

What difficulties does a greasy road present to : machine with such small wheels might be asked This, of course, depends to a great extent upon the experience of the rider and the type of scooter used but, during our trial with the Skootamota in question (it was loaned by Messrs. Gilbert Campling, Ltd., I Albemarle Street, London, W.1), no difficulties, so fa as skidding is concerned, were encountered. Should the rider, however, experience a side-slip, the distanc from the footboard to the road is so small that a spil should be impossible.

THE "T.T." AND "TRADE."

Manufacturing Difficulties Not the Only Reason for Probable Lack of Entries.

HAT it is not desirable to hold the T.T. Race this year appears to be an opinion shared by several manufacturers of motor cycles. among those who had fully intended to compete, there are now many who have had to abandon the idea owing to the delays caused by the moulders' strike. Among these latter may be mentioned Messrs. Josiah Parkes and Sons, Ltd. (the makers of the Union engine), Veloce, Ltd., Messrs. Bradbury and Co., Ltd., and Messrs. Chater-Lea, Ltd. Several other manufacturers will not enter on account of other difficulties chiefly concerned with reconstruction problems. Among these are Messrs, F. E. Baker, Ltd., the makers of the Beardmore-Precision motor cycle.

Probable Entrants.

Quite a large number, of course, take a more optimistic view and have already signified their intention of entering, and these include such firms as the Sopwith Aviation Engineering Co., Ltd. (A.B.C.), the Wooler Motor Cycle Co., Ltd., Paragon Motor Manufacturing Co., Messrs. Humphries and Dawes, Ltd. (O.K.), Messrs. Butterfields, Ltd. (Levis), the D.F. and M. Engineering Co. (Diamond), Messrs. Cashmore Bros. (Alecto), Messrs. Hanwell and Sons Components, Ltd. (Cedos), and Messrs. S. A. Newman, Ltd. (Ivy).

A significant feature of the above list is the proportion of newcomers to the motor cycle world. By this progressive attitude there is every indication that they are bidding for recognition; a fact which firms having established reputations should not casually

There are other reasons responsible for the withdrawal of support this year, and, in this connection, we publish a letter from the Triumph Cycle Co. in which the questions of national economy and output are put forward. The decision of this important company not to race this year may have serious effect upon the "entry."

To the Editor of The Motor Cycle.

Sir,—My directors have carefully considered the advis-bility of participating in races or trials during the comin season, especially the Tourist Trophy Race in the Isle (Man, and have come to the decision that it would not it in the interests of the company, or of the trade generally

to do so.

Will you permit me to explain, if only inadequately, the reasons which have guided my directors? The present with satisfactory state of trade is not only based, as we often added to the industrial unrest dominating the world, but also on the depreciation of the value of money. Among the chief remedies mentioned for the latter disturbance as economy and output.

The Triumph Cycle Co. knows from experience that the special preparation of machines for a particular race great hampers the output; the result of such restriction in trace

it is impossible to give in exact figures.

Economy and Output.

As regards economy, we do not think that the participatic As regards economy, we do not think that the participative in a race, which is connected with great expense, is a nece sity for the furtherance of the trade. It may be argue that the Tourist Trophy Race has contributed a great de to the present efficiency of the motor cycle. We have accepted this argument and acted in accordance with it. having participated in every race but one, when the man facturers unanimously decided not to do so. Besides, it Triumph motor cycle, having been adopted as one of first and argument and the British Government during it was been adopted those five very severe and the standard machines by the British Government during it. war, has had such an experience during those five years is will necessarily counterbalance many Tourist Trophy Race The Triumph Cycle Co. believes that it can further the interests of the country and of the trade better by con-

centrating all its energies on an increased output rath than by participating in races which, as has already bet stated, must have a very detrimental effect on the output

of the company.

It must not be forgotten that, owing to the protracte moulders' strike, valuable ground has been lost. Deliver which were promised for past months have been, and w be, delayed, and under the present circumstances it is almo

impossible to regain lost ground.

For these reasons the company has decided not to bus special machines for the Tourist Trophy Race, and to absta during the coming season from those trials where special constructed machines are essential in order to ensure succes
Yours faithfully,

FOR THE TRIUMPH CYCLE Co., LTD., Edw. G. Firkin.

THE POLICEWOMEN OF LONDON.

A Few Humorous Notes on All-weather Riding and Ladies' Riding Apparel.

By COMMANDANT DAMER-DAWSON, O.B.E.

The writer.

TEMBERS of the Women Police Service are congratulating themselves on the possession of the Olympia Show model 3½ h.p. Sunbeam sidear outfit. This "Rolls-Royce" of motor cycle outfits s the most valued possession of Sub-Commandant M. 3. Allen, O.B.E. It carries as its mascot a silver nodel (or should we say caricature) of a "brother pobby," with a brass clock under one arm and a hand aised in time-honoured fashion.

Our sister-riders will welcome the advent of this perfect little roadster. Think of a sidecar with a nudguard so broad that no splashes can adorn the passenger's face, and a wheel so constructed that one in extracted enables the rider to pull out the whole vheel from under the mudguard, slip on a spare, and nend the punctured tyre at leisure.

I was riding a big 8 h.p. combination in pouring vet twilight a few weeks back. Bang went the front yre miles from anywhere! Wheels supposed to be nterchangeable. In the growing dark the various 'washers" rolled helter-skelter, and oh, the Chinese nuzzle to fit that spare wheel, and its washers! When t last all seemed well I found the cone gradually

Commandant Damer-Dawson, O.B.E., with a 1920 Olympia Show model Sunbeam.

uncloing itself-a terrible wobble resulting. It was a borrowed mount, so I will not abuse it further-perhaps its owner understands its tricks better.

Our service owns a varied fleet, among which may be found the Sunbeam, Enfield, Rover, Levis, and Matchless. Among them all I love best a little green 3½ h.p. Sunbeam—a faithful war service friend. It

is not pretty to look at now—rather like Charles Kings-ley's "Doll" poetry—"The paint on her cheeks washed away, dear "-but to me it will always be "the dearest doll in the world." What an engine! It purrs all day almost enoiselessly. Twice has it trotted to North Wales and back this year, and once to Scotland. Another prime favourite is a black and gold colleague ridden by Sub-Commandant Allen, who has many times inspected policewomen all over the United Kingdom. In the sidecars we carry our luggage, enough for a fortnight's tour, spare tin of petrol, and lunch basket. The greasy hills of Halifax, Huddersfield, or Sheffield, equally with indescribable stony mountain tracks in North and South Sub-Commandant Allen, Wales, have no terrors for these excellent machines. I went of the riding apparel from London to North Wales

O.B.E. The suitability will be appreciated.

and back again this summer without having to put a tool on the outfit or even change a tyre or plug. This is what I call a reliable machine.

A Comparison.

- In the early days of the war our service possessed two cars. We were very proud of them, and placed them and ourselves at the disposal of our male colleagues for air raid and emergency work. But the trouble they gave us! How we cranked and cranked at 2 a.m. on an icy winter night, when the Germans would come and would not wait for us. How our brother bobbies cranked also in vain. Then came petrol shortage, and we took to motor cycles. When the call came "Report at nearest police station in seven minutes," our handy mounts were ready to go off first kick, in jumped the passengers, and we were ready to go anywhere at top speed.

There will be no more grateful or more enthusiastic metor cyclists than we of the Women Police Service in the glorious days of open roads and joy rides galore.

The Policewomen of London .-

Are we down-hearted about taxes, the rise in petrol, or rotten roads? Not a bit of it, for we know that nothing can or will daunt the real motor cyclist. He and she know joys that no Chancellor of the Exchequer and no petrol combine or Transport Minister can choke. Where there's a will there's a way! Are we not enfranchised citizens? M.P.'s, beware! Have we not tongues and pens, and The Motor Cycle to voice our wrongs?

But I must say a word upon dress. These are a woman's views written in The Motor Cycle for women readers, and we must not forget that dress came before the 'franchise. We are so interested and so amused to read all that is written in motor cycle journals of the struggles of our sisters to settle motor cycling dress for women, and we appreciate the kindliness of some male encouragers and smile at the venomous "boot" given by some jealous young bloods and stone-age old fogies. Of course, we ride in breeches and boots. With mufti we sometimes affect stockings with bright tops and Scotch garters with tassels and smart brown brogues. Corduroy breeches with corduroy riding coat and hat to match we have

proved can be smart enough to wear without adverse notice in the smartest hotel.

Our experience is that as motor cycle riders whether in uniform or mufti (we have gained a very wide and varied experience in the last four years), we have met with unfailing courtesy from men and women, much interest from all classes of society, and have made some very valued and firm friends while on the road.

The Value of Mudshields.

Mud! It does not trouble us. We can ride ou Sunbeams with legshields in the muddiest Londor streets, and arrive with blue cloth and topboots un spotted. If it rains hard, the naval "slip-on," wit inner oilskin or mackintosh lining and mackintosh over alls, is an impervious and easily donned protection.

We can claim that we are all-weather riders. We have undertaken "inspections" in blizzards with toe fronts to our coats, and are occasionally almost blow off the road when crossing the Romney Marshes in howling sou'-wester—but nothing cools our ardour calters our conviction that a motor cycle with or without sidecar is a fine sport and tremendous convenience for women as well as for men.

FRENCH NOTES.

No Sidecars in this Year's Grand Prix for Motor Cycles and Cycle Cars.

IT is on Saturday, August 28th, that the French Motor Cycle Grand Prix and the Cycle Car Grand Prix will be run in the neighbourhood of Le Mans. These two races, which will be held together, will be the most important speed contests of their kind in France, for, although the detail organisation is left in the competent hands of the Automobile Club of the Sarthe, they nevertheless constitute the official events of the Automobile Club of France.

The last time the Motor Cycle Grand Prix was run was in 1913. The following year all preparations had been made, but the war interfered with the realisation. Several changes have been made in the rules since the last race. Notable among these is the increased distance and elimination of sidecars. The authorities have been led to this decision by reason of the very poor showing made by sidecar machines in the past, and it is considered that they do not lend themselves to high speeds. It should be remembered that this is a speed contest pure and simple, held on practically level and very fast roads, carefully protected at all dangerous points.

Grand Prix Course.

On the day following the motor cycle and cycle car races there will be held an important voiturette or light car race. The detailed rules of this have not yet been published.

The Sarthe course selected for the Grand Prix is 33½ miles round. The 500 c.c. machines will have to cover nine laps, or 301½ miles. For the 350 c.c. machines the distance is reduced to eight laps, or 268 miles, and for both the 250 c.c. motor cycles and the 750 c.c. and the 1,100 c.c. cycle cars, the distance will be seven laps, or 224½ miles. In accordance with the general rules of the Union Motocycliste de France, there will be a minimum weight for each class of machine. The 250 c.c.

machines must weigh not less than 88 lb. without oil or petrol; for the 350 c.c. machines the minimu weight is 110 lb., and for the 500 c.c. machines the minimum weight is 132 lb.

Two classes are provided for the Cycle Car Grar Prix, one of these being 750 c.c. machines having minimum weight of 3 cwt., and the other the 1,100 c. machines weighing not less than 3 cwt. 49 lb. Fight small cycle cars, the minimum tyre size is 55 mm the bigger cycle cars must have 60 mm. tyre size least. All the cycle cars must be fitted with a clutt

and change-speed gear, and must carry two person throughout the whole of the race.

Some Regulations.

For both the motor cycle and cycle car races, at the essential organs will be scaled and must not learning the contest. Tyre and petrol pi will be established opposite the grandstands, at supplies can only be taken from this point. At competitor receiving outside assistance away from the grandstand will be disqualified. Entries for the two races are received both by the Union Mot cycliste de France, Place de la Concorde, Paris, at by the Automobile Club de l'Ouest, Le Mans. The latest date for receiving entries at ordinary fees June 15th, but entries can be made on payment double fees until July 15th.

In France competitors must be supplied with the regulation driving and road licence, but in the case of foreign competitors, the international car and driving ticence will be accepted in place of these. In the way, British competitors who bring their machines be road and who enter France with the usual tripty issued by the Motor Union, will not have any specificant by the motor union, will not have any specific the contribution of the supplies to the specific production.

formalities to comply with.

The cylinder measurements will be verified on Augu 26th and 27th, no tolerance being made.

FRICTION CLUTCHES FOR MOTOR CYCLES.

By R. WARING-BROWN, AM LA.E.

art I.—Some Remarks on Clutch Design and Descriptions of the Best Known Types.

The design of a clutch may make or nur an otherwise good machine. With the object of discussing the ndvantages and disadvantages of the different types of clutches on modern motor cycles, the accompanying article-written by an experienced designer-has been prepared. The writer holds the view that, notwithstanding the perfection to which the modern clutch has attained, finality has not in any way been reached.

THE adoption of free engine and speed gear transmission is accepted as standard practice on the modern motor cycle, and the advantages gained the use of such transmission are very apparent.

se are made possible by the use of some form of ch whereby the transmission of power from the ine to the road wheels may be gradually applied juickly disengaged.

In investigation of the subject, it is first necessary observe the chief essentials in the design of a really cessful clutch. These are:

t.) Capability of transmitting the full power of the ine efficiently.

2.) Simplicity in construction.

3.) Accessibility and ease of adjustment.

'here are three types of friction clutch in general for motor cycle engines, viz., cone, band, and e; and, as far as design goes, their calculation is mple matter.

There T = Torque or twisting moment in pound-feet.

r=Revolutions per minute.

H.P. = Maximum horse-power to be transmitted. n the initial calculations for a clutch, the informa-. at the disposal of the designer is the maximum er to be transmitted and the revolutionary speed eet per minute. From this the torque or twisting nent may be obtained from formula:

(.)
$$T = \frac{5^2 5^2 \text{ H.P.}}{r}$$

'he design of a motor cycle clutch presents a culty not frequently found on a car or other hinery, in that the space at the designer's disal-is very limited.

The Cone Clutch,

n early designs the simple cone clutch was frently adopted, and is still used, although not extenly on motor cycles. This is probably due to the

fact that, to be absolutely successful, the cones require to be of comparatively large diameter, which is not always possible, owing to the restricted space at the designer's disposal. The cone clutch involves an important point in reference to the angle of the friction surfaces. The smaller the angle the less the axial pressure F. This may be seen from the calculation where

P=Pressure in pounds acting perpendicular to the cone surface (usually about 40 lb. per sq. in.).

Then

 $F = P \times \sin a$

It will be easily understood that the angle of the cone surface (a) must not be too small, as otherwise the clutch would tend to "jam," and become difficult to withdraw.

The three factors attending the design of a cone clutch are:

(1.) The frictional resistance between the surfaces in contact (µ).

(2.) The radius of clutch (R). (3.) The angle of the cone (a).

Hence it will be seen that, being limited in regard to pressure on the friction surfaces, and also to their angularity, the designer has only two flexible particulars, viz., diameter and width. As showing what has been done in cone clutches, it is interesting to examine designs herewith.

The only clutch of the cone type which the writer remembers favourably was a design fitted to an F.N. shaft-driven machine, shown in fig. 1, where it will be noted more space is available. A is the outer member of the clutch, consisting of a cast iron annular face bolted to the flywheel. B is the inner member driving the primary gearshafts through a flexible coupling C. It will be seen that this clutch is of adequate diameter and surface, and is extremely simple in construction.

It is obvious that if high powers can be transmitted on cars solely through the medium of friction, the

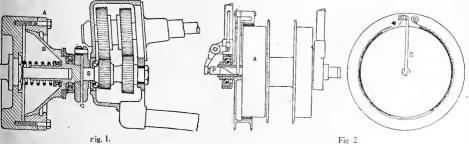

Fig 2

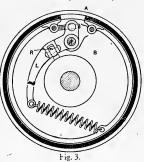

Friction Clutches for Motor Cycles .-

same is possible on a motor cycle by the provision of a friction surface of ample dimensions.

The Band Clutch.

Band clutches can be of two kinds, viz., contracting and expanding. At a first glance it would appear that there is fittle to choose between either of these types. On consideration, however, there is a considerable

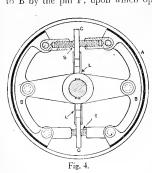

difference. high speeds, such as are employed in motor cycle engines, the centrifugal force on the band has quite an effect on the friction between the band and the drum. Centrifugal force at high speeds tends to expand the band, and hence to decrease the force of a

contracting band, and to increase the frictional force of an expanding clutch. The band clutch is most generally used where the transmission gear is of the

epicyclic type.

In fig. 2 is shown, diagrammatically, a common design incorporated in a rear wheel transmission. Where epicyclic gear is enclosed inside the clutch drum A contracting bands are fitted, and the pressure is applied through a spring and lever L, which thrusts against a plunger P having a helical cam cut upon it. This cam, in turn, forces rod R, attached to links, outwards, thereby contracting the band on to the drum.

The method of applying the expanding type is shown in fig. 3. A and B are the driving and driven drums respectively. The expanding mechanism is mounted to B by the pin P, upon which operates the lever L,

whose movement controls the expansion of the band. This lever L has fitted to it a roller R, which is acted upon by a wedge. The whole is embodied in the rear wheel, in a similar manner to preceding the example. The which drawback shows itself most, both in practice and theory, is the

very great difficulty of balancing this type of clutch retationally. The advantage of the band clutch is the partial and sometimes complete elimination of end thrust.

Segmental Clutches.

These are clutches wherein the driven members of the clutch are formed in segments. The one in fig. 4 is really an offspring of the band type, except the segments are formed as blocks. The axial presis transmitted through a sliding sleeve, to whice attached levers L acting on collars C attached screws, having right and left-hand threads S. forward movement of these levers rotates the screwhich thrust the segments B outwards against drum A. It will be seen that the axial pressum multiplied by the mechanical advantages of the product mechanism employed. It is advisable not to a greater pressure than 50 lb. per square inch, which per cent. less pressure will greatly enh success in this type. The axial pressure is nature diminished in this pattern, but the rotating when the clutch is disengaged is very consideral

The clutch shown in fig. 5 is another type of mental clutch, designed on the principle of the Ro son friction gear, and is a Premier design. clutching action is produced by expanding a section inner member A outwards until it engages steel plates B keyed to the hub shell C. The member has V grooves which give maximum fit surface. The cone D, which expands the segm

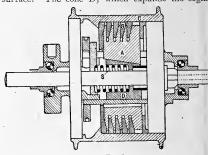

Fig. 5.

is held in action by the spring S. When this is pressed by the actuating rod working through centre of the spindle, the clutch members are tively drawn out of engagement.

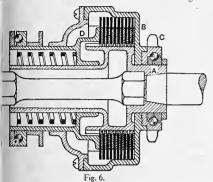

Plate Clutches.

There are three general types of plate clute use, viz.. corrugated plate, multiple plate, and si plate. All these types are the outcome of the orig Weston clutch, which is on the principle of m gripping surfaces. As friction increases in propor to the number of pairs of friction surfaces in con it is possible to increase their number and multiple resistance due to friction to any desired amount

The outstanding feature of the Hele-Shaw clis the use of friction plates, stamped to form a rugation at an angle of 30-40°. The surface contact are limited to the raised part of the plawhich are arranged in series of driving and dr members. The driven members are free to slaterally, but are prevented from rotating by key the drum connected to the driven shaft. The driplates also are allowed lateral movement, and keyed to the inside of the casing connected to driving or engine-shaft. It will readily be un stood that the force required to press the plates gether is inversely proportional to the number

tion Clutches for Motor Cycles .-

tes and their effective diameter. By corrugating plates, as in the Hele-Shaw, the axial pressure reduced practically fifty per cent,; consequently, a given pressure, the clutch will transmit twice turning effort of an equal number of flat plates similar materials. The other advantages of this ch are that, under conditions where heat is gener-

d, the shape of the plate allows of the free cirtion of lubricant, thereby forming a means of t dissipation. The corrugations add so greatly to strength of the plates that distortion is practically possible. The calculations for this type of clutch, and the same designations as previously, are as ows, where

'N=Number of pairs of friction surfaces.

a=Angle of corrugations.

$$F = \frac{T \times \sin \alpha}{R \times N \times \mu} = \frac{Q \times \sin \alpha}{N \times \mu}$$

At the same time, the disadvantage of this type n its slow disengagement, due to oil between the tes. For this reason springs are fitted to the plates separate them.

Multiple Flat Plate Clutch,

This type of clutch is made to innumerable designs, number of plates used being anything from two twenty. They possess the advantages and disadtages of the corrugated plate type. They have further disadvantage in an increase of pressure uired to keep the plates together, the formula in case being:

$$F = \frac{T}{R \times N \times \mu}$$

In slipping this type of clutch, obviously great heat is set up, which it is not possible to dissipate efficiently as the nature of the plates does not allow free circulation of the oil. Consequently, the plates have a tendency to burn and buckle. The plates are frequently perforated in order to allow of a better circulation of the lubricant and also to diminish the tendency which they have of sticking together.

Elimination of End Thrust.

In fig. 6 is shown a Chater-Lea design for chain drive. A is the driving centre fixed to the engineshaft, and B is the driven drum, which is connected to the chain gear C. D is a presser ring, forcing the driving and driven friction plates together under the

influence of coil spring S. The most satisfactory results are obtainable with plates alternately bronze

and steel.

Another interesting example of a clutch which has only two plates is that illustrated in fig. 7. This is fitted to the German Magnet machine, runs in oil, and is embodied in the belt pulley on a countershaft. The two dises MN inside the pulley flanges P are pressed apart by eight springs (S), and are connected to the hub carrying the small chain wheel R, driving on to the rear wheel. In the end of the axle A, which does not revolve, is a quick-thread screw, operated by lever D, which, by means of a distance piece F, presses against the centre of the part M when lever D is turned in a right-hand direction; thus, M and N

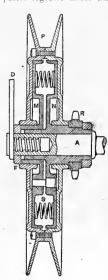

Fig. 7.

are drawn together, and the clutch consequently released. This clutch has several good features, amongst which are notably the equalised pressure, and consequent elimination of end thrust, both in and out of action; also, there is a good leverage for disengagement, which is obtained by means of the screwed lever. The friction surfaces are of cast iron and steel and in practice work together well.

(To be continued.)

THE MOTOR CYCLE AND AVIATION.

ECENTLY we observed an aeroplane landing in a field some two miles from a town, and were surprised to see that a motor cycle was urely fixed to the side of the fuselage. Enquiries me the pilot revealed the fact that he was touring air in order to arrange for suitable flying grounds. it is not always possible to land near a town, an on two-stroke was carried to save fatiguing walks points where information could be gained. The

method of attachment was interesting, the machine resting on a special board recessed to take the tyres, and attached to the lower starboard main plane. After completing the necessary business, the motor cycle was replaced very quickly and without difficulty, the 160 h.p. Beardmore engine fitted to the Armstrong-Whitworth biplane burst into song, and the whole combination soon became a microscopic speck in the far distance.

TAXATION.

Readers' Views on the Hardships of the Proposed Increased Taxation.

TE have received many letters on the subject of the proposed alteration to the motor cycle tax from our readers, who regard the increase as an injustice, especially to the poor man whose riding time is confined to week-ends with the consequence that his yearly mileage is low. A flat rate bears very heavily on such a man, who possibly runs a sidecar outfit to give his wife and family a breath of country air, in comparison with the leisured class who may very likely ride ten times the distance.

We note that the Motor Legislation Committee disclaim all responsibility for the proposals, which they say "have perhaps been injudiciously and prematurely published."

Below are extracts from some of the letters received: Sir,—The proposed new taxes have prompted me to compile the enclosed tables, showing at a glance what the motorist who runs up only a small mileage per annum will have to pay, compared with the man of more miles. Petrol prices are assumed, i.e., 3s. less tax, and 3s. 6d. with tax. It will interest many motor cyclists like the writer.

® .	Total Miles per Annum.	Miles per Gallon.	Price of Petrol.	Tax, Cycle and Sidecar.	Total Cost of Petrol, including Cycle Tax.	Total Cost of Petrol, per Gallon, including Cycle Tax.
4½ h.p., Based	1,000	50	3/-	8o /-	140/~	7/-

Tax.	3,000	50	3/6	20 /-	230/-	3/10

[This letter was written before the increase in price.-ED. 1,000 MILES PER ANNUM.

Sir,-May I be allowed to express my opinion on what I consider an unfair system of taxation. There are thousands of working men, like myself, who, shut up in factories all the week, enjoy a short run on a motor cycle at a week-end; for, after all, the actual maker of the article in question is a factory hand. My point is this. Under the proposed new system of taxing motor cycles it will be extremely unfair for this class of rider, inasmuch as the rich motorist, who lives on unearned income, and to whom the appeal for increased production matters little, will escape as lightly as will the labourer. As is well known, the majority of workers would not cover a great distance in the course of a year. The more one rides, the more one should pay.

JAMES REECE.

Sir,-Sir Eric Geddes is reported to have said that the new taxation is to be based on the use of the roads and the amount of damage done to the roads by different classes of vehicles, and that motor cycles with the right to draw a sidecar will be taxed £4. I fail to see how the amount has been arrived at. There are thousands of motor cyclists who only get the opportunity of using their machines for a few hours at week-ends during three months of the year, and who have to deny themselves in other directions for the pleasure of having a ride and taking their wives and children for a spin through the country lanes. This tax will mean that they will be paying at the rate of 6s. for each run, exclusive of petrol, tyres, etc., supposing they are fortunate enough to have twelve or fourteen rides during the season. Add to this the cost of petrol, tyres, insurance, and garage, it will mean that the average motor cyclist will be forced to give it up. Certainly the writer for one.

W.T.J. Plumstead

Sir,-In reference to the taxation and registration Sir,—In reference to the taxation and registration motor cycles, I think it is excessive, and a hard hit working men, like my father and myself, who look to little enjoyment at the end of the week, and an opportun of getting a few hours' run out into the country to obta little fresh air, which we are deprived of from Monutil Saturday. I should be pleased to see in your colur a general dissatisfaction of the Government's behaving the statement of the control of the control of the first should be pleased to see in your colur a general dissatisfaction of the Government's behaving the should be should b

Sir,—Statements have recently appeared in the press porting to be an intelligent anticipation of the recommendation of the recommend tions of the Departmental Committee of the Ministry Transport, which is known to be now considering the ques

As the name of the Motor Legislation Committee has I confused with that of the Government Advisory Commit concused with that of the Government Advisory Confinit I should be grateful if you would allow me to state that blotor Legislation Committee is a body absolutely it pendent of the Ministry of Transport. It has in no s-countenanced the proposals which have perhaps been judiciously and prematurely published. Nor is it opinion of the Motor Legislation Committee that it of usefully, at the present moment, publicly express opinion for or against a schedule of direct vehicle taxa opmint for or against a schedule of the terror of the period duties, which is stated to the provisional recommendation of a confidential Governm Committee. ALFRED HACKING, General Secretary, Motor Legislation Committe

Sir,—I think this instance of how the new proposed on sidecars (£4) hits will show how unfair it is. I have an old twin (thirteen years old) and sidecar,

have spent the best part of a year since demobilisation dit up in spare time, fitting magneto, etc. I shall probuse it once a fortnight or perhaps once a week, owing long hours and not being in the engineering trade.

My last ride was in 1915, and now I must give up m cycling after four years of the rough.

Surely the petrol tax would be more fair to all.

F. VICTOI

Sir,-It is with great alarm that I read of the proper increased taxation of motor cycles. The increase seems of all proportion, and will prevent very many people is continuing to use motor cycles, and many more from be ning the sport at all. The tax will press most unfairly those who can least afford the increase—e.g., the "km who has money and time to do nothing but run about country on a lightweight with probably a passenger on carrier, will get off with 30s., while the struggling far carrier, will get off with 30s., while the struggling far man, who has only week-ends for the pastime, and is oblited have a powerful 'hus to carry his load, will have to £4. The only fair way of increasing the tax and mathose who use the roads most pay the most towards the is to put a stiff tax on petrol; then the man with a he'bus, but who only has time for week-end runs, would of pay according to his petrol consumption.

All motor spirit of any kind should be taxed so that one could possibly avoid paying. Even if the existing r licence were doubled and a tax put on motor spirit, the would not be much grumbling. A motor bicycle of heaviest type does scarcely any damage to the roads fact, at present, it is the roads that damage the bicyc It is the heavy lorries and 'buses and steam tractors wil tear them to pieces, and it is on these that the burden the taxation should chiefly fall.

There must be thousands of people in England who There must be thousands of people in Lagrangian only just afford to keep a sidecar and who do so enable them to get their wives and children about with the endless expense and bother of train journeys. They do not not so that the long as the old is not want to go fast, but are content as long as the old gets there; the damage they do to the road is negligibut the good they do to themselves and their families incalculable

WILFRID M. BEAL

NOISE: Its Value and Assistance to Motor Cyclists.

A Few Extracts from a Paper by Dr. A. M. Low, A.C.G.I., D.Sc., etc., read before the Cumberland County M.C.C.

T is a very humiliating thought to realise that the modern motor cycle ossesses silence only relatively.

There can be no question that in inter can be an question that in a liter street a 'motor cycle is noisy, and, hen we remember that every kind of ise means wear and loss of some kind, is alone should give us a hint of the terest in the subject uf noise and sound. If a Rolls-Royce six feet wide can wel through traffic safely and silently, rely a motor cycle can do the same. Noise is produced by irregular vibra-Make is produced by friegular vibra-ns of air, and owing to our particular sysical construction it is unpleasant. All forms of sound waves are relatively

gular vibrations.

Let us now see of what particular in-

lest this is to a motor cyclist. It is by means of noise and sound and r cars that we do practically every yele operation on a motor cycle. Riding night is a proof of this, for our eyes e solely occupied in seeing the way. Our eyesight does not tell us whether a tehine is running well, it does not tell to change gear neatly, and it does not of the heavy feeling of a machine eding a lower gear is due to the ear.

Noise and Sound.

Not only do we drive well or badly by and and noise, but we use these two ides almost entirely when we are lging the efficiency or otherwise of a tor cycle quite apart from mere tech-al investigations, which can be con-

Noise and sound differ solely as we ve considered, by being either irregular regular vibration respectively.

Vibration exists in the forms of life, ctricity, heat, sound, and noise.

Sound is a regular oscillation, and refore has a building-up effect.

Now on a motor cycle there are very my noises, and still more parts which we irregularly at portions of their total vement, such as a valve, and regularly oughout their movement, such as an

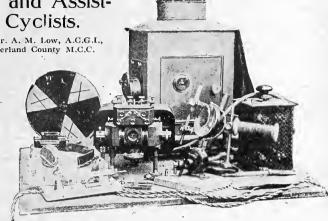

limary hub bearing which contains Is moving partially irregularly. Jutte a number of mysterious sounds to be investigated; by running on ferent gears and at different speeds it easy to see whether a noise synchroes with the rate of movement of the in, the belt, gear box, or wheels: At the same time, one can distinguish

ween a distinct tap and a knock due a rough cam by noticing how often per time revolution this noise occurs, and can then see whether it synchronises in the crankshaft speed or with the ve or half-time shaft.

This is, of course, exceedingly simple; ny other types of noise can be ex-ined in the same way.

Other sounds can be tested for sepa-

ely. Suppose, for example, one has her a loose aluminium piston in an

Some of the apparatus used at Dr. Low's lecture to Cumberland County M.C.C., at which an apparatus was shown for photographically recording noises.

engine, it is very interesting to try the machine both hot and cold and at different speeds.

If one has a two-stroke engine, and it is suspected that a loose gudgeon pin exists, or if one wishes to distinguish between a carbon knock and a gudgeon pin, which may not be always an easy case, it is a good plan to run the engine fast, and then to slow down and accelerate again, simply because we all know that at high speeds the load on reciprocating bearing parts is far greater due to inertia than it is to actual explosion.

The same case applies to overheated plugs and similar points; that is to say, one can try the effect of accelerating on high gear or intermediate gears in order to see at what particular speed an engine will make a noise.

Periodic Vibrations.

Often, we must remember, we deliberately run on wrong mixture in order to make up for other mechanical faults, and in many engines overheating will only appear at particular speeds or carburetter settings, just as sometimes a machine will be running with perfect regu-larity and will suddenly get into a state of vibration. This is usually due to the synchronisation of out-of-balance forces.

It is not possible to balance a singlecylinder engine perfectly when con-structed in the ordinary manner, and, therefore, all forms of balance are a compromise, and an engine must either be balanced for low or high speed.

Testing by Sounds.

An intelligent examination of sounds produced from an engine is practically the only method adopted by road testers, and if the public once realise how important it is to use their ears we would

have fewer overworked engines.

Take the example of a worn tappet when the engine is raced under load, and

suddenly shut off and opened up again

stowly. In almost every case a knock will result as the engine is shut off, but will entirely disappear when the throttle is reoponed, and the pressure in the cylinder becomes sufficient to steady the valve against the bouncing effect produced by the spring. This I have actually tested, examining the valve in motion by means of a cinematograph.

Varying the sparking point of the mixture will also often show a definite cause of knocking, and help us to distinguish the reason.

In cases where slackness of drive is suspected, the obvious method to adopt is that of producing reversal of stress, either by brake application or by raising the exhaust valve and suddenly dropping it when the engine has slowed down.

In the same way the application of the foot to the pulley of an engine will often either stop a noise entirely or make it worse, clearly showing that we have a loose bearing, and nothing to do with conflecting rod or piston attachment. All these noises are what I may call determinate noises.

Bad roads show up indeterminate or periodic sounds, whereas most deter-minate noises are more of the nature of sound than noise.

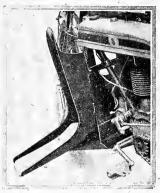

It is extraordinary how most riders can be content with the most weird noises proceeding from their machines, and a trip in a sidecar attached to a motor cycle which the rider has never yet heard except as a rider will often astonish him. It was once said by the elder Mr.

Winans, who was a great lover of horses, that if these animals could cry out every time they were slightly hurt it would be impossible for passers-by in the street to hear themselves speak.

If people would only realise how they are hurting motors by not listening to their gentle voices complaining, they would save half the troubles which exist.

A LEG GUARD AND FRONT SHIFLD.

THE day cannot be far distant when every motor cyclist will be able to mount his machine on a muddy day without troubling to don special overalls to keep the mud from his legs. Quite a large number of riders have devised really

A useful type of leg shield, tootboard, and front shield. The leg shield and footboards, it will be observed; are hinged, permitting easy access to the engine.

efficient guards, and those whose business is connected with motor cycles are placing them on the market. Soon, perhaps, manufacturers will render these extras unnecessary by turning out their machines equipped with such fitments; in the meantime, no doubt there will be a big de-

One of the latter is about to be placed on the market by Messrs. Forfield Motors, Leamington, and has been designed by H. Stretton Ward, a Midland competition rider, who is one of the partners of the

concern. As will be seen from the illustrations, the guards are hinged, by lantern hinges, to a front shield, so that by

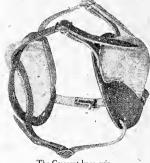

releasing a butterfly nut attaching the former to the footrests the leg guards

may be swing outwards to give accessibility to the engine. The footrest portion of the guards is fitted with rubber mats.

The illustration of a complete Triumph machine gives a good idea of the ex-tremely neat appearance these guards present when fitted, and also shows the large degree of protection which is afforded to the magneto and lower portion . of the engine where it is most needed, especially on machines which have not the protection of a specially designed front mudguard. The designer is to be congratulated upon the pleasing appearance of his product.

THE CRESCENT KNEF-GRIP.

K NEE-GRIPS are very popular among motor cyclists, and the particular pattern under review is most effective. The pads are mounted on circular leather discs with slots for the straps arranged at intervals so that the position of the pads may be altered to suit the taste and fancy of the rider. As at

The Crescent knee-grip.

present arranged on our machine, the pads are so adjusted that the knees fit tightly up against them, thus giving an additional sense of security when in the saddle. The Crescent knee-grips are made by H. Bednall, 55, Sutton Crescent, Walsall, who specialises in leather caps, helmets, and wrist straps.

A USEFUL MAGNETO KNIFE.

HERE have been many magneto knives on the market containing a blade, a file, and a platinum point gauge, but the one illustrated is the only specimen we have seen which contains a plug tester. This tester consists of a a ping tester. This tester consists of a vulcanite body and adjustable spark gap, and is so arranged that it can be held between the terminal and body of the plug while the machine is running and thus indicates whether or not the current is passing. The distance of the gap adjustable by knocking one of the meta

Brown Bros. magneto knife.

portions to one side. It is sold by Messr Brown Brothers, Ltd., 15, Newman Stree London; W.1.

TWO USEFUL TOOLS.

MOTOR cyclists who are capable doing their own repairs will interested in two small machi tools which form useful adjuncts to workshop. One of these is a small se sitive drilling machine, while the oth

is a grinding and polishing head. B these may be driven by foot pow by means of a small electric mot mot or by other means. They are reas able in price, and any skilful amat

A polishing head well suited for a motor cyclist's workshop.

possessed of a lathe may manufacte them himself from castings which u be supplied by the makers, the Sr Brass Foundry, Rylance Road, Wige

VERHEAD VALVE GEAR.

Sir.—In The Motor Cycle for January 22nd I have seen the article, "Back to Pfain Bearings?" and the illustration f overhead valve and tappet gear, by "Ubique." I wish to smind this gentleman that this illustration is the subject f a Mag patent, and is very similar to the design of the verhead inlet valve gear on Mag engines.

THE MAG ENGINE COMPANY, LTD.

OSBORNE DE LISSA, Managing Director.

ATE OF THE MOTOR CYCLE SHOW.

Sir,-May I trespass upon your space to put forward a lea for the holding of the Motor Cycle Show in Angust or lecember, as there are many hundreds of prospective buyers etween the ages of 16 and 18 who cannot get away for the how in November, and by this fact are prevented from noosing their machines from a large selection of models, ad thus have to choose it from the comparatively small election available at an agent's or local dealer's?

Malvern. PUBLIC SCHOOLBOY.

HE PATENT LAWS.

Sir,-May I point out to your readers that the third attement in the letter of Messrs. Phillipss relating to the atents and Designs Act, 1919, which appeared in your sue of January 29th, is incorrect, if the investigation sterred to is that made in the Patent Office? The investition for novelty prescribed by Sections 7 and 8 of the atents and Designs Act of 1907 is in no way extended by te Act of 1919. According, however, to Section 4 of the tter Act, an opposition to the grant of a patent may be minded on "any document published in the United King-

As regards the last statement in the same letter, it should noted that the position of solicitors is unaltered by the ct of 1919, and this is expressly stated in the Act.

TANDARD TYRE SIZES.

Sir, Our attention has been called to reports which have cently appeared in the technical press of a meeting of mopean manufacturers, representing England, France, aly, and Belgium, recently held in Paris, when it was cided to adopt certain sizes of pneumatic tyres. As these ports are likely to create a wrong impression, we beg to vise you that this Association, the official organisation the British rubber type industry, had no part in the gotiations referred to, and does not accept the range of and only the productions of the production of the andards named.

Our Association has for some time had the question of re standardisation in hand and formulated proposals, which re accepted by the official organisations of the car makers, stor cycle and cycle manufacturers, and wheel and rim anufacturers. These proposals were laid before the British geneering Standards Association, and we understand an terim report will shortly be issued by that body setting the complete range of sizes of all classes of pneumatic d solid rubber types and rims adopted as British standards.
We shall be glad if you will give publicity to this commication. THE BRITISH RÜBBER

TYRE MANUFACTURERS' ASSOCIATION, LTD., W. B. PEAT AND Co., General Secretaries.

PRICE OF FUEL.

Sir,—In The Motor Cycle of January 29th I read with interest your remarks on "Home-produced Fuels." For some time past there has been "talk" of advance in prices of imported fuels; and the only way to counteract these threatened advances is to use and support home produce. But how are we encouraged to support home production?

But how are we encouraged to support home produce. But how are we encouraged to support home production? When I turn to page 125 of The Motor Cycle, I find, without any "talk" or previous threats, that N.B.A. benzole is advanced from 2s. 9d. to 3s. 1d. per gallon.

Are we in the toils of a "home ring" as well as a "petrol ring"?

Derby.

INCREASING THE BRILLIANCE OF ACETYLENE LIGHT.

Sir,—With reference to your article, which appeared in your paper of January 8th, concerning carbide economy, may I add the following hint :

If a little hydrogen peroxide is added to the water for the generator I have found that a noticeably more brilliant light is obtained. One teaspoonful of hydrogen peroxide to half a pint of water was sufficient in my case.

CHARLES W. VINES.

[An ounce of hydrogen peroxide to a pint of soft water is said to increase the light by upwards of 60%, 2 ounces by nearly 70%; beyond this point the increase is at first slight, then it drops.— E_{D} .]

PISTON RINGS.

Sir,-With reference to your contributor's, George Harley's, article on piston rings, the following may be interesting:

It can he shown mathematically that if a piston ring is turned to a diameter larger than its cylinder, has a portion of its length removed at the cut, and then has its ends bulled together by a tangential force, and, being clamped in this position, is finally turned on the outside to the cylinder diameter, it will, when in the cylinder, press with exactly equal force on the cylinder walls all round, whether it is of even thickness or tapered as Mr. Harley recom-

I have made piston rings on these lines in the following way, with results which are in every way perfect.

The rings are cut from a concentrically bored cylinder of

such a diameter as to allow of the necessary portion being

removed, and with an extra small excess diameter to allow for final turning, say, 1/32in, for motor cycle diameters.

A jig is made, consisting of a bar with a flange in its middle, slightly less than the diameter of the cylinder, and a washer fitted on the bar part and secured to the fixed flange with three or four bolts or a nut running on a thread in the bar. The rings, after cutting, are laid, three or four at a time, in a thin tim or brass clip, with two small bolts passing through its bent-up ends, so that the clip and the rings in it may be closed up with a near approach to the "tangential force" of the mathematician. The rings are then clamped between the fixed and loose collar on the jig, set to run true, the clip removed, and are then turned with a light cut. All that remains is to file the allowance for expansion given by Mr. Harley from the end of each ring, and the job is done.

V.P.

LARGER ENGINES.

Sir,-As a reader of your invaluable paper since 1911, may I endorse the remarks of your correspondent, "Jay Gee," on the subject of "Larger Engines."

Although, as a matter of principle, I would not ride a foreign machine, one must admit that, broadly speaking,

America is the home of the big engine.

I have a friend who owns two big American machines; he would prefer English ones if he could get them as powerful. I do not wish to touch on the subject of English v. American machines, but may I suggest that, if the smaller English engine is more efficient than the American, why not huild up this engine to the size of its rival, and let the

I notice immediately following "Jay Gee's" article comes one on "Protection from Mud and Rain." Now, surely, if we had larger engines we should see more luxurious sidecars giving the extra protection required; one would not then feel that power was being sacrificed for comfort.

There are still a large number of people who prefer the powerful sidecar combination to the light car.

W B. CLEGG.

A "PASSENGER SIX DAYS".

Sir,—Your contributor, "Ixion," has always something interesting to say, and his contribution about passenger trials deserves careful attention. There can be no doubt that' passenger machines have more in common with each other than have sidecars and three-wheelers with solo motor cycles; also, that it is more useful to compare the runabout and cycle car (the names are unsatisfactory, but there are no better) with the sidecar than with the luxurious light car. The man who can afford £500 will not be much interested in a Morgan or a G.N. (though I know owners of large cars who keep a Morgan as a tender), whereas the owner of a sidecar is very much interested in a runabout or cycle car, and vice versa. The difficulty of arranging a "Passenger Six Days" is, as "Lxion" says, the question of classification. At present the definition of a light car is based upon horse-power.

So long as 1,100 c.c. was the limit this was fairly satisfactory, especially whilst it included a weight limit; but now that the limit is 1,600 it is another story. The price limit is to be preferred, especially if a consumption limit be added. It is significant that the first light car trial was

run on a price limit.

run on a price limit.

Probably most people would be in favour of such a trial as "Ixion" suggests if a competent authority-could be found to conduct it. I believe that the Junior Car Club could do so if it were willing, but this seems doubtful. There seems to be a reluctance on the part of the club to have any dealings with sidecars, and it would be difficult for it to exclude any light car, however highly priced. The name of the club is against it; but is it impossible for the R.A.C. and

the A.C.U. to appoint a joint committee?

If such a trial is impossible, it seems to me that the best means of comparing all kinds of light passenger machines is to hold two Six Days Trials over the same course and under precisely similar conditions, either in England or Scotland, or, preferably, in both. In this way all machines would be put to the same test, and the public could judge their performance. Let me add that, in my opinion, the three-wheelers will be well advised for the present, and until some-such scheme as "Ixion's" can be carried out, to remain under the A.C.U. Their most-to-be-considered competitor is the H. GEORGE MORGAN.

THE SINGLE-GEARED LIGHTWEIGHT.

Sir,-I notice in The Motor Cycle of January 8th a photograph of Mr. Hugh Mason, climbing Clara Street, Newcastlegraph of Mr. Hugh Mason, climbing Clara Street, Aewcastle-on-Tyne, on a N.U.T., and I can say from my experience that it is a fairly stiff proposition, on account of the steep rise at the foot. I have been up this bill on a number of machines, but the most interesting climb was on a little single-genered 2½ hp. Villiers engined New Ryder two-stroke. I got right to the top of the bill written any aid at the first attempt. I toured the Lake District and part of Scotland last summer on this same machine. Starting from Monk-eaton, I passed through Newcastle, Haydon Bridge, Alston, eaton, I passed through Newcastle, Haydon Brugge, Alston, Penrith, and Kendal on the first day. The second day I took things easy, as the scenery was lovely, and viewed Windermere, Rydal Water, Grasmere, Thirlmere, and Derwentwater, putting up for the night at Keswick. Third day, I passed lasgow. Fourth day I rode through Bearsden to Drymen.

and Loch Lomond, then made tracks for Dunfermline, passing and Loca Lomond, then made tracks for Duniermine, passing through Stirling, Bridge of Allan, Tillicoultry, and Rumbling Bridge. Fifth day I crossed the Forth at Queensferry, and passed through Edinburgh, Dalkeith, Coldstream, Wooler, and arrived at Monkseaton early in the evening feeling very

fit after my short tour.

The only hill I fail

The only hill I failed on was between Grasmere and Keswick, known, I think, as Dunmail Raise. I got nearly to the top, when a head wind beat me.

The distance covered on this run was about 500 miles. Petrol and benzole used, five gallons. Oil, about two quarts. Thus, I averaged 100 m.p.g., not a bad performance considering the contour of the country covered.

The only adjustment I made to the machine was to tighten up the cones in the front wheel hub, with a small spanner which I carried in my pocket. The tool-bags were never once opened. I oiled the bicycle parts once, and that was near Stirling.

I have no connection with either the New Ryder or illiers firms.

J. B. TAYLOR.

Villiers firms.

THE MACHINE FOR SPORT.

Sir,-It was with great regret that I marked the falling off in numbers of the sporting solo single at the Show. I mean the machine fitted with a neat simple engine of about 500 c.c. in a strong rigid frame with T.T. bars, the whole being utterly destitute of such unnecessary hoojahs as gear boxes, clutches, and the like. As far as I can see, the only firms who still boast such models in their original form are Rover and Norton. Only two survivors out of such a mighty

Surely there must be hundreds of young riders like myself who regard this type as the only mount worth riding for pleasure. Personally, I know no more fascinating sport than riding a high compression, high geared 3½ h.p. through heavy traffic, provided one does not mind a little strenuous pushing at times.

Riding this type, one learns to study one's engine, and, with a large exhaust, one hears every complaint that it makes when one juggles with the air and throttle levers. As one gets to know one's 'bus, it is a great pleasure to realise that one can give it just that perfect mixture which affords maximum power and speed.

It is an art in itself to get good acceleration without knock-

ing out of a fixed gear three-and-a-half, yet what acceleration

means can only be demonstrated on such a mount.

On a big single-geared machine one must be continually alert, the throttle and air must be kept moving to suit the road, and the engine to a much greater degree than on a sidecar 'bus.

On a machine "with every modern convenience" one has a similar sensation of being out of work, and consequently bored, as when driving a particularly sluggish touring ear which surely cannot be compared to riding a fast motor

cycle solo without a clutch.

I have never owned a machine which boasted gears, except one with the delightful Philipson pulley, and I do not ever want to. This is in spite of experience of other people's pukka machines which simply bristle with gadgets and fittings of all sorts.

In the old days, when engines needed gear boxes and clutches, there were no such things: now, when they are unnecessary, every motor bicycle is cluttered up with such gadgets till you can scarcely see the engine at all. Present engines are hot stuff, but will they go into a decline? They perhaps every machine will be woolly and high compression be a thing of the past, and everyone who yearns for excite ment will have to save up and buy an aeroplane or a sporting

light car, which costs nearly as much nowadays.

I am becoming morbid. We are all right really so long a Rover and Norton continue to keep us supplied with the goods and firmly resist the guiles of the gadget fiend; but I was sorry to miss my old friends. Requiescant in pace

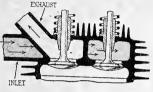

Bournemouth.

Correspondents are urged to express themselves as concisely as possible, especially in view of the fact that only a small. percentage of letters received can possibly be published. Many interesting letters are unavoidably omitted in conse quence of their abnormal length.

N IMPROVEMENT IN AIR-COOLING.

Sir,—Re Mr. Hawley Morgan's ideas in improved air-oling and "Rider's" letter in your issue of January 15th, my I add a further suggestion? In order that there shall a no possibility of the draught of air "short circuiting" flowing across the tops of the fins, I would have a efinite channel for the air thus: Cast the cylinder of ironith the fins spiral, and machine the edges; cast the jacket aluminium, also with fins on the outside. Machine the side to such a size as will make a light joint when shrunk 1 the cylinder. Naturally, overhead valves would present e-simplest job; the cold air would be drawn in round the chaust valve port, and the greater heat of the iron cylinground the would probably make up for the greater expansion of a luminium. I may say I put this idea before a sominent firm of car manufacturers some years ago, in-nding to use a fan in the flywheel, crank case compression the iron and iron a

on, or the indate the and not Mr. ought of Mr. ector principle, it they thought ater v cooling ore satisfac-ry. Another Another y in which

oling might be proved is by

king the mixture after it comes from the carburetter flow

the corburet valve nort before taking one mixture after it comes from the carouretter now rough a duct cast round the exhaust valve port before reaches the inlet port. This would be very simple in side-by-side valve engine; if the mixture only passed besuce-y-side vaive engine; if the mixture only passed been the exhust port and cylinder, I believe a great impovement would result. I expect theorists will say the xture would get too hot, resulting in wire-drawing; if it could easily be cooled by taking a pipe out into the ragain. Overheating is the greatest drawback with motor less to-day; half our troubles would disappear if our lines would stand full throttle for six hours on end, as we should do without warning their cylinders and using y should do, without warping their cylinders and using much oil as a five-seater car. I enclose sketch of overid valve engine with induction passing round the exhaust t. PSEUDO-DESIGNER.

EED WOBBLE.

Sir, -In the issue of The Motor Cycle of January 22nd, xion," referring to my letter, asks two questions about xion," referring to my letter, asks two questions about speed wobble theories. The first question "Ixion" answered himself, saying that I "will hardly find chine on the road which has its front wheel centre in line of the steering head axis, yet a large percentage of sting machines do not wobble at the speeds which are the thing that the compass." (Italics are mine.) I have pointed two conditions of wobbling: Position of the centre of front wheel, and the position of the centre of gravity. upose it is quite clear that a different combination of se two positions gives a very wide range of wobble ting speeds. Some of the machines are practically unbling because they simply cannot reach a critical speed. only a machine with the centre of front wheel in the of the steering head axis will not wobble at any speed, he second question, about the centre of gravity, is not imple, and needs some experiments. I quite agree with don't that the centre of gravity is higher when a rider in the saddle. But I notice that my machine becomes e steady when I stand on the footboards, therefore I cose that the centre of gravity of the machine changes place according to the riding position. [Standing upon footboards does not, of course, lower the centre of

footboards does not, or coarse, vity.—ED.]

Ixion" does not give to us any description of his ampion wobbler," and I should like to know if it has following features: (1) Nearly vestical position of the ring head tube; (2) centre of the front wheel is in the incly forward position; (3) distance from the approximately forward position; (3) distance for the rear wheel is held less than the same to the front wheel? If my control is a control is a control is a control in the footboard of the wobbling his machine "at all speeds."

NICHOLAS OLECHNOVICH (Lieut.).

Sir,—I have read with great interest a letter signed "E. B. Ball" in your issue of January 29th, with reference to speed on the road, and I am in entire agreement with all your correspondent states.

I have ridden, during 1911, a T.T. Triumph, and in 1912 a T.T. Rover, both machines having done well over 65

m.p.h. before I sold them, and never had a suspicion of a "wobble" when all out on either.
In 1913-14 I rode a 23 h.p. Douglas, which has done 61 m.p.h. stripped, over short distances, and never "wobbled."

It was quite easy to ride any one of the foregoing "hands off" from about 20 to 45 m.p.h., and for this reason I should be very glad if one or more of your renders, who may possess a "wobbly" bus, will state at what speeds it is possible to ride it "hands off"—if at all.

I have yet to ride a T.T. machine which developed a "wobble" that could not be cured in a couple of seconds. Cambridge.

PROTECTION FOR THE DRIVER.

Sir,-I have been an interested reader of The Motor Cycle for several years, and although I have only had an ordinary push bicycle for the past two years, I still get your delightful paper, and thoroughly enjoy the reading of it over the week-ends.

I disposed of my 31 h.p. combination fully two years ago, and having reached an age when comfort, etc., is a serious consideration, I vowed then that with my next mount, whatever it should be, I must have more comfort and protection from the weather. I have kept careful watch on all your publications regarding this subject, and especially followed the controversy that raged round the Scott Sociable, but up to the present have not come across the ideal between the cycle combination and the light car.

I am unable to afford a car, and I know there must he hundreds in the same position, who, failing something not keep on grumbling, or, like myself, will, like the immortal "Micawber," wait and see if something more suitable will turn up. A. and I feel that may be prophiled to the transport of the control "Micawber," waif and see if something more suitable will turn up. And I feel that such a machine is not beyond the brains of our British designers. One of these days, I am certain, a genius will hit on the right idea, and we middle-aged riders, with our wives, will be able to enjoy our weekend spin clean and in comfort, and not be arriving at our friend's house more like scarecrows than human beings.

Now, I am neither a genius nor a designer, yet many a time when looking at my old combination, I wondered if it

time when looking at my old combination, I wondered if it was an impossible proposition so to design the sidecar that it would also protect the driver. Is there any reason why the body of the sidecar should not contain the engine, etc., of the cycle, come up in front between the forewheel and the frame, and so go right over to the outside of the driver's right leg, he still sitting astride his machine, while his partner's seat could be brought forward and raised to a level with his? This would allow them to converse without all the pedestrians on the King's highway hearing what was being said. The steering of such an arrangement might present some difficulty, but I think it could be managed. I should like to hear opinions as to the teasibility or otherwise of the idea, as it seems quite practical and capable of accomplishments. ment; while several motor cyclists to whom I have mentioned it seemed to think the idea all right.

Meantime, let me again assure you, and those who are interested in motor manufacture, that there is indeed a great market open when the right thing comes along at a reason A MIDDLE-AGED RIDER. able price.

One Year's Production.

Motor car manufacturers estimate that 1,700,000 passenger cars will be produced in the U.S.A. this year.

New Index Marks.

Motor vehicles, registered in Liver-pool, which at present bear the index mark K and KB, have the additional mark KC. Bristol motor vehicles, besides being marked AE, may now hear the letters HT, while London has received an additional index, XA.

Monument to Sir John Alcock.

It will interest many motor cyclists to learn that a movement is afoot to commemorate Sir John Alcock's work as an aviator. The Daily Sketch is opening its columns to a public subscription list, among the chief donations up to the present being a 1920 Douglas coupé car. The directors of the Douglas Motors, Ltd., were about to present Sir John with this car, but. unfortunately, his tragic death prevented this happening. Sir John Alcock was an enthusiastic motor cyclist, and was in close association for many years with Mr. S. L. Bailey, of Messrs. Douglas Motors.

Petrol Prices.

A correspondent has forwarded the following figures relating to the cost of importing and distributing American motor spirit. It is only fair to state that the source of information may be not untinged by interest. Also with regard to the price of petrol in New York. We believe we are correct in stating that at the beginning of January petrol could be obtained at 19 cents per American gallon in New York, i.e., approximately 1s. 34d. per imperial gallon—not 25 cents, as stated:

"The selling price to the public is now 2s. 0½d. for the ordinary petrol of commerce. Out of this the retail dealer has as his profit 4½d.; the wholesale distribution charges in two-gallon cans cannot be put at less than 7½d.; the duty is 6d.; American petrol, as the correspondent in the Daily Telegraph has it, can be bought at about 25 cents per American gallon, which, at to-day's rate of exchange, is equal to 1s. 8½d. per imperial gallon—one-fifth larger than the American gallon—one-fifth larger than the American gallon. The charges first enumerated, plus the cost of the petrol, equal 3s. 2½d., or 2d. more than the public are now paying for their petrol, and, 'in addition, nothing whatever is left for the freight. In addition to the above, the wholesale distribution is safe and economic distribution."

Royal Motor Cyclists.

Motor bicycles are growing in popularity with the undergraduate to an even greater extent than before the war.

T.R.H. Prince Albert and Prince Henry were seen last week with their Douglas' motor cycles at Robinson's Garage, where they called in the ordinary way for some minor adjustments. Their Royal Highnesses are using their machines in a similar manner to other members of the University for the purposes of keeping engagements or reaching the golf links and the river.

Fixing a Price.

From our sister journal The Autocar we notice that an excellent example to manufacturers is set by Vauxhall Motors, Ltd., who have adopted the policy of fixing a definite price for a predetermined number of cars. This example might well be followed by motor cycle firms, as it would undoubtedly appeal to the

A miniature motor bicycle owned by Mr. Alfred Kidd. 14. Humphrey Street, Old Kent Road, London, S.E. This he uses daily in travelling to and from his work. It will be observed that the motive power is an Auto-wheel unit used as the rear wheel. The frame and the front forks are built on redal cycle lines.

NOISE.

CLUTCH DESIGN

Oil from Shale in the U.S.A.

Manufacture of oil from oil shale destined to assume a more prominer place in the U.S.A. than it now occupie

An Acknowledgment.

We are indebted to Messrs. Sutton an Sons, seedsmen, Reading, for the admi able photographs used in illustrating the article entitled "The Motor Fuel of the Future" last week.

From the Midlands to the North.

We are constantly being asked frontes from the Midlands to the Nor of England. One of our corresponden points out that the best route is via the Fosseway, most of which is in an excellent state of repair. There, is a bestretch, now being repaired, while begins two miles after leaving the Leicester-Melton road, and ends at the "Durham Ox"; after that the surface in first-class condition. There is verified to the first-class condition.

A Suggestion.

A reader in the extreme North of England complains that, owing to thindifferent railway service to his district his weekly copy of The Motor Cycle not always obtainable on Thursday moring. He suggests that we despatch surpless to such districts by lorry or acrylane, oblivious of the fact that, despi poor organisation, the average speed trains is infinitely greater than that lorries, while several squadrons of the largest aircraft would be required deal with the tons of copies distribute each week.

American Licence Number Plates.

Our American correspondent writes follows:

"This is the season of the year when a our States change the colour scheme of their licence plates. As we understand you use the same tag year in and year or same tag and same number. We do not some 1912 New Jersey has used blue ay ellow, red and white, green and whit white and blue, brown and white, blue and white, grey and white, and red at white. That is only one instance, awe have forty-eight States. Some colocombinations are the result. The me weird we ever lamped was Indiana 1915, brick red and green,"

To British readers the system of issui a new number plate each year may appe somewhat cumbersome, but it should recollected that it eliminates separt taxation, and the annually chang numbers are useful as a visible and p manent receipt for the payment of tannual tax.

A Paris-Nice Team.

The Sutton Coldfield and North Birningham A.C. has nominated H. O. Wood, Rex Mundy, and Albert Milner as the club team.

At a motor cycle club dinner last week in Nottingham, Mr. A. R. Atkey, M.P., humorously suggested that the people who walk should be taxed, as they are the real time wasters—the people who are clogging the wheels of progress.

James Employees' Trial.

In the recent trial organised by the James Cycle Co., Ltd., H. Wardle was awarded the premier sidecar prize of a awarded the premner succear prize of a fighting set, which had been presented by Messrs. F.R.S. In the solo class of 500 c.c. or over, Povey won the gold medal, V. Davies taking the silver medal for the best performance in the twostroke class.

The Price of Petrol.

There appears to be a great deal of confusion as to what is the "official" price of petrol. Last week retailers were harging 3s. 9d. and 3s. 10d. per gallon, which represents in the first case a profit of 5d. per gallon, and in the latter 15% in the wholesale price. At the time of toing to press, however, we are informed by the Motor Traders' Association that he "official" price is 3s. 81d. per gallon and 3s. 64d. for No. 1 and No. 2 respec-

member.

Fully two hundred members of the above and kindred clubs gathered together on the occasion of the first annual dinner, which was held at the Grosvenor Reswhich was held at the Grosvetor Restaurant on Saturday last. A most enjoyable evening was spent, and the president, Mr. W. N. Simpson, gave a brief summary of the life of the club, outlining the past and future programme. The ultimate aim of the club is to acquire an official club house, which would be the rendezvous of all motor cyclists in the West of Scotland. Valuable trophies are to be competed for this season, including a 100 guinea challenge shield (presented by the James Cycle Co.), sixty guinea cup (presented by the Leicester Rubber Co.), twenty guinea cup to be won outright (presented by the Palmer Tyre Co.), the McLean Challenge Cup, also prizes of twenty guineas (presented by Mr. George Stevens) and ten guineas (presented by Mr. John Robertson). The season opens on March 6th with a reliability trial.

Coventry's reminder of the late war. The Tank now installed in Grey Friars Green was officially unveiled this week. Note the extra petrol tank of the Triumph two-stroke.

ore Difficult M.C.C. Competitions.

In the past the Motor Cycling Club is been not unjustifiably accused of aking its competitions too easy, and epending too much on keeping time to litth of a second, with the object of iding a winner. For 1920 the more important events-

in by this popular club will be conderably improved for the better. As entioned in last week's issue, the Edinurgh run is to be stiffened up considerly, and the return journey part of the Yeecooooooooooo

conclusion of the trials will be free to

return home in their own time.

Motor cyclists who intend entering for the Jarrott Cup competition must their applications for membership to the secretary, Mr. Southcomb May, 34, Gower Place, London, W.C., to reach him not later than March 1st.

The capacity of the engine fitted in the American Militor machine is 1,145 c.c., and not 1,592 c.c. as stated last week.

MOTOR (YCLE SPRING NUMBER AND BUYERS' GUIDE.

MARCH 25th has been fixed as the date of the Annual Spring Number of The Motor Cycle. Special articles are in course of preparation, and a feature of the issue will be an illustrated Buyers' Guide.

THE 1920 Tourist Trophy Races.

Extracts from the General Conditions and Regulations.

Object of the Races.

HE international Tourist Trophy races are organised with the object of assisting the development of the touring motor bicycle. They are not intended for purely racing motor cycles, neither are they necessarily races between existing standard types.

In order specially to encourage the manufacture of lightweight motor cycles, entries of machines with engines not exceeding 250 c.c. capacity have been

invited.

The Course.

The races will be run over a course starting from a point near Douglas, Isle of Man, thence via Ballacraine, Lirkmichael, Ballaugh, Sulby, and Ramsey, and over Snaefell mountain, back to the starting point; one circuit being a distance of 37 miles 4 furlongs. The length of the Senior Race will be six circuits, making a total distance of 225 miles, and that of the Junior Race will be five circuits, equal to a distance of 187 miles 4 furlongs.

Awards.

The entrant of the winning motor bicycle in each race will be entitled to hold the Junior or Senior Tourist Trophy under terms of an agreement. In addition, the driver of the winning motor bicycle will in the Senior Race receive £50 and a special gold medal; and in the Junior Race £40 and a special gold The drivers of the second and third motor bicycles in each race will receive respectively £25 and £15 Senior Race, and £20 and £10 Junior Race.

A gold medal will be awarded in each race to the entrant of every motor bicycle that completes the course within thirty minutes of the winner's time—except in the case of motor bicycles not exceeding 250 c.c. engine capacity, when the period shall be calculated from the time at which the fastest machine of that

capacity finishes the course.

The Motor Cycle lightweight cup will be awarded to the entrant of the winning motor bicycle having an engine capacity

not exceeding 250 c.c.

Team prizes will be awarded on points to the nominated team of motor bicycles in each race, all of which finish within thirty minutes of the winner's time. One team only may be nominated by each entrant.

THE "NISBET" AWARD.—The stewards of the meeting will be empowered to grant the "Nisbet" award to such competitor or competitors who, in their opinion, shall have exhibited such pluck and endurance, or such capacity to triumph over difficulties, as to deserve special recognition. It shall rest with the stewards either to grant or withhold this special award in any year at their discretion.

Entries.

1. Competitors Eligible.—Every competitor must be on the competitors' register of the Union, of the Scottish Auto Cycle Union, of the Motor Cycle Union of Ireland, of any Colonial club recognised by the Union, or of any club in the F.I.C.M.

2. LIMITATION OF ENTRIES .- The Union reserves the right to refuse any entry without assigning any reason, and to limit the number of acceptances as circumstances may require.

3. When Receivable.—Entries for 1920, at ordinary fees, will be received by the Union at 83, Pall Mall, London, S.W.1, up to noon of Monday, May 3rd After that date entries will be received at double fees up to noon of Monday,

4. FEES.—The entry fee shall be £21. 5. FEES NON-RETURNABLE.-Unless, in the opinion of the Union, sufficient entries are received, no race will be held. The entry fee will be returned in full if no race be held, but under no other circumstances will it be returnable.

6. Specification and Guaranter.— Every entrant shall supply the Union, not later than May 17th, a complete specification of the motor cycle or motor or motor cycles entered by him, and no variation in this specification shall be permitted unless application in writing is made to the Union by the entrant not less than three clear days before the race, which application it shall be within the discretion of the Union to grant or not.

Equipment. :

7. Specification of Motor Cycles. SENIOR RACE.—A motor cycle entered for the Senior Race must comply with the following specification:

following specification:

ENGINE: Internal combustion, cylinder capacity not exceeding 500 c.c. Weight: Not less than 60 kilos (123 lb.), without oil, fuel, or tools. Tyres: Minimum diameter 55 mm. (2.17in.), with cover and inner tube separate, fitted with at least three security bolts, one of which may be a bolt valve. Brakes: Two, working independently. Foot. Bac. One. Munporaros: 10 measure not less than 75 mm. (2.95in.) across the chord, and to cover at least 120 of the carrierance of the rear wheel. Sadde of Seat: One. Stand 13 gallons.

8. Special carrierance of Morone Caylors than 14 gallons.

8. Specification of Motor Cycles. JUNIOR RACE.—A motor cycle entered for the Junior Race must comply with the

following specification:

Ioliowing specimenton: Encircle the translation of the control of ference of the rear wheel. Saddle or Seat: One.
Stand: One. Petrol Tank Capacity: Not less than 14 gallons.

Provided that in the case of motor bicycles with engines not exceeding 250 c.c. capacity the weight, size of tyres, mudgnards, and petrol tank capacity may

be reduced as follows:

WEIGHT NOT IES. Hall 40 kilos (88.18 lh.), without oit, fuel, or tools. Tyres: Minimum diameter 45 mm. (1.7 im.), with cover and inner tube separate, fitted, with a least three security bolts, one of which may be a bolt valve. Mupcukans: To measure not less than 65 mm. (2.56 in.) across the chord, and to cover at least 129° of the circumference of the front wheel, and TANK CAPACITY: Not less than 1 gallon.

9. Disqualification.—The Union reserves the right to disqualify any motor cycle from which, in its opinion, any essential detail is omitted or is imperfectly applied.

10. SILENCERS .- Silencers are not compulsory in the race, but they must be fitted for practising, and at all other times during which the motor cycle is on the Island. Such silencers must conon the Island. Such silencers must con-form in all respects to the regulations laid down by the Local Government Board of Great Britain, which came into force on April 1st, 1913. Any motor cycle driven, except in the race, without a silencer will be hable to disqualification. When detached for the purposes of the race, the exhaust must be carried by a pine or purps from the engine, extending. pipe or pipes from the engine, extending as far back as the back axle, in such a position as not to discharge directly upon the ground. When auxiliary ports are fitted, they must be closed in completely, and the chamber into which they discharge must lead into either the exhaust pipe or silencer.

Practising.

14. Practising. — Practising, which will be regulated and supervised by the Union, will be allowed at certain definite times. From the day on which prac-commences until the conclusion of the races no competitor will be allowed to traverse (except during the hours of practising and during the races) any part of the course on any description of motor vehicle, other than as a passenger, with-out having first obtained a permit to drive over the course, or any part of it, from the Union. Competitors should note that the roads are not closed to other traffic during the times allotted for may then be encountered.

15. Minimum Amount of Practice.—

A motor cycle will not be allowed to start unless the driver has completed at least six circuits of the course in practice, one of which must be covered in one hour by drivers in the Senior Race, and one hour and ten minutes by drivers in the Junior Race. Provided that, in the case of drivers of motor cycles with engines not exceeding 250 c.c. capacity,

this time shall be extended to one hour and thirty minutes.

Inspection and Examination.

17. WEIGHING.—Both the competitors and their motor cycles will be weighed, and the weights will be published.

NEWS FROM THE I.O.M.

Our Isle of Man correspondent advises that hundreds of men-mostly discharged soldiers—are now employed getting the I.O.M. roads in good condition, and that the Manxmen are again organising a carnival, to be held during the T.T. week, which is to make it the "biggest week of the season."

There is a little hitch, -however, concerning the necessary formalities to legalise the race. A special Act to close the roads has to be passed by Tynwald. the Manx Parliament, and at the present time there is a constitutional crisis, the House of Keys refusing to meet in Tyn wald; consequently the resolution authorising the continuance of the Act is held up. It is hoped, however, that every thing will be settled in time for the races.

Notes on the Paris-Nice Trial.

An Instructive Trial with a Representative Entry. Fuel Shortage Probable.

TO-MORROW (Friday) morning at six o'clock the first man will start from Paris on the 650 miles French reliability trial, Nice being the destination. The day's run of 193 miles will end at Dijon, whence a start will be made at 5 a.m. on Saturday. Lyons is the next stop (the distance being 124 miles), and the latter place is left on Sunday morning, again at five o'clock. A day's run of 193 miles will bring the competitors to Marseilles, where the third night is passed. The final stage of 140 miles from Marseilles to Nice is commenced at 6 a.m. on Monday.

A "starting from cold" test and brake test will be held on the morning of the 17th inst. (Tuesday) on the Promenade des Anglais at Nice, while the afternoon will be devoted to an examination of the machines. In the evening the competitors may relax at the Bal Masque at the Opera, and on Wednesday they are free to explore the Riviera on their machines.

A separate hill-climbing competition from Nice to La Turbie takes place on Thursday, February 19th, for which cups and prizes are being offered.

Some of the Rules.

During the actual Paris-Nice trial, an average speed of 183/4 m.p.h. must be maintained, an allowance of ten minutes before or behind schedule time being allowed. Solo machines of 250 c.c. and 350 c.c. sidecars will be allowed fifteen minutes. For each minute earlier or later than these tolerances permit, one mark will be deducted.

Most of the spare parts carried will be stamped, and to those who do not need them a bonus of twenty marks will be given, and two marks will be deducted for each item used.

The competition will be of great interest owing to the number and variety of entrants. At the moment of writing, the entry is made up of seventy-six solo riders and forty-six sidecarists. There are six cycle cars and fourteen unclassified entries.

Additional Entrants.

In addition to the official list of entrants for the Paris-Nice run, published in the issues for January 22nd and 29th, the following entries have also been received. Class 1, 250 c.c.—W. J. Brunell (Junior Thiumph). Class 2, 350 c.c.—Girardi (Garelli). Class 3, 500 c.c.—Detriuchi (A.B.C.), Isodi (Stucchi), and Georges Delaunay (Stucchi). Class 4, 750 c.c.—Russel King (Scott). Class 5, 1,000 c.c.—Vache (Janoir). (In this class Duverne replaces Huret.) Sidecars: Class 8.—Bastide (Norton) and Felix Delaunay (Stucchi). Class 9, 1,000 c.c.—Max Cyril Morris (Matchless). (In this class Pletsier will ride the Harley-Davidson already entered, and Huret rides a Janoir.)

Scarcity of Motor Spirit.

At the moment of going to press, we learn that the fuel situation in France is decidedly grave, and it would not be entirely surprising if considerable difficulty is experienced by competitors during the course of the trial.

M. Sweerts, the organiser, informs us, however, that he has made the necessary provision to ensure the success of the event, despite the situation which has

The Colmore Cup Trial.

Some Comments on the New Marking for Flexibility Hill-climbs.

THE Sutton Coldfield and North Birmingham A.C. regulations for the trial for the Colmore Cup (presented by Mr. F. S. Whitworth) can now be obtained from the Trials Secretary, Mr. P. Mosefale, the Nook, Maney Hill Road, Sutton Coldfield, and all entries must be in his hands by Wednesday, February 18th.

The start will be from the George-in-the-Tree Hotel, Berkswell, at 8 a.m. on Saturday, February 28th, and he route will be as in previous years. Lunch will be taken at Cheltenham, where, as well as at the inish, competitors must sign time check sheets. The competition will be conducted as a non-stop run (with he exception of the luncheon interval), and no adjustments will be permitted.

The flexibility test will consist of one hundred yards idden slowly, followed by one hundred yards ridden it speed uphill, and a new method of marking will be used. The slow part will not be taken into the eckoning, but it must not exceed 6 m.p.h. For the ast part of the climb, the formula recommended by the Motor Cycle for hill-climbs will be used, viz., $\frac{1}{N}$. It has been objected that, in so short a dis-

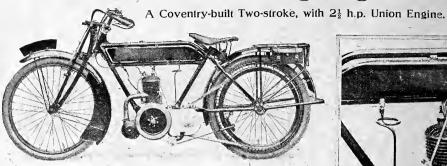

Acceleration Test.

We do not think that there is anything in this objection, and that, if the smaller machine can show better acceleration on formula, it deserves to win. The wise rider will open his throttle before reaching the end of the slow section if his speed enables him to do so, and the larger machine should be able to climb more slowly, and thus leave its rider with a greater margin in hand for this purpose.

The principal award will, of course, be the Colmore Cup, but the Calthorpe Motorcyclette Trophy will be awarded for the best performance on a machine up to 257 c.c., and the Levis Cup for the best performance on a single-geared mount. There will also be several special prizes, gold medals, and certificates.

tance as one hundred yards, a big machine will not be able to obtain sufficient advantage in time to equal the performance of one of less capacity. For instance, if a 350 c.c. machine, weighing 350 lb., takes 10 secs. to cover the fast hundred yards, its figure of merit will be 100. To equal this, a 1,000 c.c. machine, weighing 467 lb. (both weights with rider), must cover the distance in less than 7 secs.

The C.M.M. - Union Lightweight.

The latest addition to the number of the lightweights using the Union engine, the C.M.M.

NOTHER addition to the ranks of A NOTHER addition to the ranks of the light two-stroke halls from the Coventry Motor Mart, London Road, Coventry. It is fitted with the well-known Union two-stroke engine, a Runbaken magneto being driven from the crankshaft. The latest type Amac two lever carburetter supplies the mixture, and is neatly fixed at the side of the cylinder. Three models are listed single-geared, two-speed, and two-speed with clutch and kick-starter—the prices being £60 5s., £65 5s., and £73 10s. respectively. A Burman two-speed gear is fitted, the primary chain being en-

Rochester, Chatham, and District M.C.

The annual general meeting of the ochester, Chatham, and District Motororder, Countries, and Bister Moories, Club was held at the Royal Crown otel, Rochester, last week, when there as a large and enthusiastic attendance motorists, which augured well for a accessful 1920 season.

It was decided that a whist drive and ance, open to the motoring fraternity, held at Queen's Hall, Chatham, on

ednesday, the 18th.

Other subjects discussed included a aggested dinner, and also the advis-ulity of organising mid-week runs and aturday afternoon competitions, in ldition to the usual Sunday runs.

The new address of the secretary, Mr. White, is 34, Maidstone Road, ochester.

The Motor Cycling Club,

After a lapse of five years, the club is ce more reviving its activities, and has ranged an opening meet for Saturday, arch 13th, at the Old Ship Hotel, arch 15th, at the Old Ship Hotel, righton, on which occasion the medals in in the recent London-Exeter run Il be presented and an interesting tertainment provided. Application for aner tickets, which are charged at . 6d. each, should be made at the linest residue were to the section. r. W. H. Wells, 366, Euston Road, W.1, as it is necessary to guarantee attendance. Ladies are cordially in-led. Members and friends intending stay in Brighton overnight are asked arrange for their own hotel accommo-It is hoped that every member Il make a special effort to be present, order that a good start may be seenred the 1920 season

Aberdare M.C.C.

A very successful dinner and prize distribution was held in connection with the above club last week. Mr. Illtyd Williams was elected president, and he has very kindly promised to give a cup. . Mr. Hurt has also offered a cap for competition purposes. - Two representatives of the Cardiff club were present, and both clubs are arranging inter-club runs this season

Surbiton and District M.C.C.

At the first annual general meeting of the Surbiton and District M.C.C., held at Woolworth's Café, Kingston-on-Thames, on January 28th, the club was launched on its career.

The club president, Dr. A. M. Low, was in the chair, and had the satisfaction of seeing a crowded meeting, in spite of the adverse weather conditions.

The club is fortunate in having as its vice-presidents Messrs. T. O. M. Sopwith, O.B.E., T. W. Longhborough, R. P. Clowes, and A. S. Mays-Smith; whilst its other officials elected at this meeting include Mr. Walter Scott, hon. treasurer; Mr. F. W. Barnes, M.I.A.E., captain; Capt. R. Charlesworth, vice-captain; and fifteen committeemen, including Messrs. Kay Don, W. Pratt, and Morgan, and the well-known lady motor cyclist, Mrs. W. Hbde.

The official opening of the club season will be marked by a Bohemian concert, the date of which will be announced later. The present membership numbers over 130, and there is every prospect of a very successful season before the club.

The subscription was fixed at one guinea, and an entrance fee of 5s.; this includes the full R.A.C. henefits of the Auto Cycle Union under Division C.

The hon. secretary, Mr. W. B. Reeve, 25, Ditton Road, Surbiton, will be pleased to hear from any prospective members in this district.

Cambridge University M.C.C.

A successful trial was held on the 31st ult., the severity of which may be gauged by the fact that out of twentytwo competitors ten only finished. A brake and acceleration test was incorporated, in which the highest marks were secured by J. V. Prestwich (Norton). The premier award went to B. A. Hall (4 Triumph), with J. R. Allen (Scott) second.

Bedford and District M.C. and L.C.C.

The inaugural moeting of this body was duly held on January 31st, when officers were elected and a committee formed. It was decided that the sphere of operations is to have a twenty-mile radius from Bedford, and over thirty riders gave in their names as intending members. The committee has set to work, and the first committee has set to work, and the first general meeting proper is to be held at the Rose Hotel, Bedford, on Saturday next, the 14th, at 7.30 p.m.

Mr. H. H. Berrie, Goldington, Beds., was appointed hon. secretary, and will be glad to forward particulars to any

person interested. There is no dearth of suggestions for the first year's programme, and a successful season is

anticipated.

N.M.C.F.U. (Wolverhampton.)

The fourth of a series of members' and friends' social evenings was held on . Saturday, the 31st ult., at the Trocadero Hotel, Wolverhampton, an attractive musical programme being presented. In the past season numerous runs, etc., were organised, while by means of convivial evenings during the winter months, the club has not been allowed to flag, and enthusiasm has been maintained, with the result that additional members have been enrolled, and an enjoyable 1920 season is assured, for which the sports committee have prewhich the sports committee have pre-pared an attractive programme. Local motor cyclists who wish to join should communicate with the hon. sec., Mr. D. J. Thornton, 62, Dudley Street, Wolverhampton.

Harrogate and District M.C.C.

The annual general meeting of this club will be held at the Imperial Café, Parliament Street, Harrogate, this evening, the 12th, at 7.30 prompt.

The usual business of a general meeting will be first transacted, followed by

a general discussion. Light refreshments

will be provided free.

Now that practically all Active Service members of the club have been demobilised, it is expected that the club will return to something like pre-war activities, and as a good programme was always given, it is hoped that many new members will be attracted, who will support the committee during the coming

All old and intending members are requested to attend this meeting, if possible, or, if unable to do so, to communicate with the hon. secretary, Mr. H. W. Fortune, St. James Chambers, Harrogate.

International Competitions.

HE number of British competitors in the Paris-Nice Trial is, we hope, a good augury for international competitions in the future. There is nothing quite so efficient as a means to create good feeling between neighbouring nations as the meeting of their representatives in a sporting event. This year the competition programme includes many such events both in this country and on the Continent, and it is a great pity that 3,000 miles of water separate Europe from America, and so prevent the riders of both continents mixing more freely. Australia, New Zealand, and South Africa, too, are precluded from international competitions for the same reason, although such distances have not prevented representative cricket and football teams, and even pedal cyclists, from competing in Overseas events. Riders, too, from distant lands have competed in the Tourist Trophy Races. The present conditions concerning motor cycle competitions are, of course, due chiefly to the fact that most competitors are enthusiastic amateurs or riders financed by the makers for whom they ride. In the days of cycle racing, it was the professional rider who generally went abroad, and, while there are professional motor cycle racers in the U.S.A., we have not their parallel on this Probably if motor cycle racing were made attractive in this country, by the building of suitable motor cycle tracks, a class of professional racer would come into being; but whether such a class is entirely desirable is a moot point, for, as a rule, when racing is reduced to a mere question of livelihood, sport takes a second place. However, the idea should not be dismissed without due consideration. The professional teams of footballers which weekly attract hundreds of thousands show that good sport can be obtained by professionalism, provided an efficient organisation exists to govern it, and in this respect the motor cycle movement should be very favourably placed.

A Petition Against Petrol Prices.

N enormous increase in the price of petrol has led the Automobile Association and Motor Union to suggest the organisation of a petition from all motors users to the Prime Minister protesting against a state of affairs which threatens to drive many motorists off the road. The suggestion is excellent,and the A.A. deserves the credit for its energetic policy, but at the same time we feel that a petition of this kind would carry more weight if it had the official backing of all the leading motoring associations. The R.A.C., the A.C.U., the Royal Scottish and Irish A.C.'s, and the M.C.U. of Ireland, should all be associated with this joint petition, when practically the whole weight of the motoring community would be brought to bear on this vital subject.

Our readers well know that we consider that the increase in the price of fuel plus the possibility of increased taxation will produce a very serious state of affairs, not only to motorists, but to the country at large, for it must be borne in mind that both factors will lead to an increased charge for all goods transported by road.

Taxation.

N another part of this issue we publish a proposal for a novel taxation scheme which has much to recommend it. The idea includes a fuel tax, which is admittedly the fairest form, in that the motor cyclist pays according to his mileage, weight, and speed. A novelty, however, is introduced in a system of rebates which are arranged in such a manner as to benefit fair trading, eliminate excess profits, and encourage the manufacture of homeproduced fuels. It is almost impossible to put forward a taxation scheme in which difficulties do not arise, and the new proposal is no exception; yet it is incomparably more just than the proposed weight basis of taxation, and we would earnestly recommend its serious consideration.

MOTOR (YCLE

Plywood Sidecars.

S everybody knows, a good many sidecars have their forepeaks held down on the chassis by means of two huge washers and a pair of bolts. A friend of mine has a capacious sidecar, built of plywood, which he hauls around the country by means of a suitably powerful bicycle. The other day he rashly put a couple of men in the sidecar and proceeded to tour at forty miles an hour. The roads being-what roads are, and the plywood having become, perhaps, a thought soggy with age and damp, the two washers aforesaid bit holes in the plywood after the fashion of a cheese-taster. The sidecar endeavoured to do a vertical climb, and the language of the stern passenger, who was an ex-sergeant-major, R.E.—but I spare you.

Enclosed Engines.

N page 785 of The Motor Cycle for December 18th will be found a photograph of Mr. Hawley Morgan's New Imperial, on which the cylinder is wholly enclosed in a cast aluminium casing, through which air is sucked by an exhaust ejector. Mr. J. L. Norton has patented a somewhat similar design, in which an engine-driven fan is employed to create the necessary current. The same idea is embodied in the experimental Palladium car. Its bonnet has a dummy radiator devoid of holes; all the air is sucked in through scoops in the sides of the bonnet, which deflect the draughts into cast aluminium jackets bolted around the cylinders; the head plate is almost exactly like Mr. Hawley Morgan's design. All these experiments indicate that cowled engines are practicable. Their merits are three in number. They are easier to clean than the naked type. They permit a machine to be properly mudproofed. They can be run for indefinite periods with the machine stationary. (Some tastes might add that their appearance is potentially better—I say "potentially" because the designers in question have not, as yet, paid much attention to looks.)

The Next Stage.

URNING for a moment to aeroplane design, most of us are familiar with the spiky and naked aspect of the primitive aeroplanes. They were almost indecent, and reminded one of Kipling's varu about an elephant losing its temper in a carriagebuilder's yard. By contrast, a modern fighting scout reminds us of a lady's shoe in a Regent Street window -it is smooth, neat, and shapely. The transformation in the external appearance of aeroplanes came to pass within six years for purely technical reasons. Aeronautical research revealed the enormous wastefulness of "drag," and the extra efficiency obtainable by scientific streamlining. The immense speeds of modern 'planes compelled designers to give the pilot better protection from the weather. Encosure and

streamlining were sheer necessities. No such tecarguments compel us to encase the works of a. cycle and streamline its external contours. Net less, there are practical arguments of great va Look at the photograph of Mr. Hawley Morgan' Imperial, mentioned in my, last paragraph. Morgan should ride it in a London-Exeter, he and his machine will keep cleaner than the a motor cycle. Yet the upper half of him wor perished with cold, the lower half of him wo spattered with mire, and the machine could be thoroughly cleaned with less than two hours work after the trip.

The "Fuselage" Type of Motor Bicyc

We are not a nation, and I dare not prophesy that we shall pr along such lines.

An Early Avro Design.

LD readers will recollect that before th Mr. A. V. Roe sketched out a "fuselage" motor bicycle with characteristic thoroug He totally enclosed both rider and mech-allowing no side gaps through which the rider could be cleared, and adding side whee stabilising purposes at starting, at low speed on skiddy surfaces. I believe he offered his to the trade without finding either takers or plagrist Of course, the Avro design was before its day.

Occasional Comments,-

now its attractions are minimised by the fact that motor cycles are still so much used for fair-weather joyriding. As a utilitarian all-weather vehicle, the motor cycle is still in its cradle. Most riders regard the Exeter entrants as a species of gentle lunatic. I cannot regard such a condition of affairs as neces-For example, within the near sarily permanent. future we may see a new industrial city, consisting of a central nucleus of factories surrounded by a five or ten mile radius by a ring of garden suburbs, each model dwelling built in the centre of an allotment. Wages will be high: some day when mass production is in full swing and "ca' canny" fallacies have exploded, motor cycles will be cheap. What more probable than that the suburban workers will motor cycle to the What less probable than that a central factories? cold and filthy type of machine should be tolerated for such purposes?

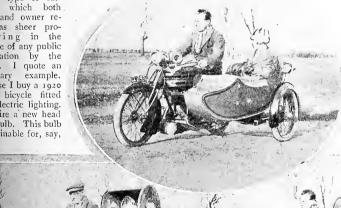

Super-surcharges.

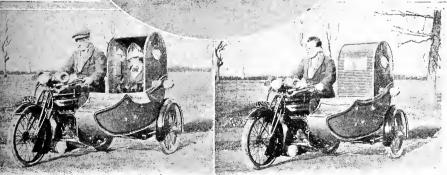

VERY sane man is aware that costs are perpetually rising, and that vendors hardly know from week to week what an article will cost in two days' time. Hence, we are all reconciled to the phenomenon of prices which are extremely elastic

with a stiff upward endency. But there s one type of sur-charge which both igent and owner regard as sheer proiteering in the absence of any public explanation by the culprit. I quote an maginary example. Suppose I buy a 1920 notor bicycle fitted vith electric lighting. require a new head amp bulb. This bulb s obtainable for, say,

3s. from the people who make it, and at the same figure from any agent who has one in stock. The local agent has no stock. I order a new bulb from the factory. When I paid for my bicycle, the invoice was for, let us say, £75 plus 20% plus 30%. I sympathetically accept the eloquent apologies and justifications with which the firm tearfully announced these successive surcharges upon articles of their own manufacture. But when they subject my little bulb to similar surcharges, I begin to kick and eke to doubt their bona fides all round. I know they have bought that bulb from the folk who made it; I know they paid trade price for it; that the village agents make a living on the percentage which separates trade price from retail price; and that trade discount plus two surcharges spells a very walloping profit indeed. If the firm sent a covering letter, saying that, owing to the moulders' strike, they had only turned over £,300 since October with weekly outgoings of £1,000, and hence were compelled to charge such prices lest the end of the company year should find them bankrupt, I might buy my bulbs elsewhere, but, at least, I should retain some respect for the firm. As it is, I-in company with thousands of others - mark such people down as sharks of the first water.

any well - managed concern, the cost of handling goods made by an outside firm should not be so high that trade discount, minus surcharges, fails to show a profit. Bad debts? Quite. I know some motor evelists are not as prompt and honest as they might be in settling petty invoices. But surely trade price is figured to include all that?

A FOLDING SIDECAR SCREEN.

On Jan. 29th, page 131, we gave details and constructional drawings of the Davies concealed sidecar hood and screen. These photographs show a design by Mr. Davies, which also incorporates the use of a roller windscreen, the hood and windscreen being easiland quickly detachable from the sidecar when necessary.

TAXATION.

Consensus of Opinion Favours a Fuel Tax as being Most Fair.

GAIN we print a selection of letters concerning the recently proposed taxation scheme. Last week a letter from an authoritative quarter suggested that the publication of the proposals was premature, and we would remind our readers, especially those who would be hardest hit by the new rates, that it is by no means certain that they will ever come into force.

Undoubtedly a fuel tax would be the fairest way of apportioning liability for road damage amongst motorists. Those who ride farthest and fastest and use the heaviest machines are those who do the greatest amount of damage, and under a fuel tax would pay most highly. Further, an extra tax might well be levied for the use of steel and steel-studded tyres. Pedal cyclists do but little damage, but a small tax might be obtained from them. It would, as a correspondent points out, give them "more voice in the matter of 'rights of the road.'"

Why not tax horse traffic more heavily? A horse's iron-shod hoofs do more damage than a motor cycle.

Sir,—The problem of taxation can be expressed in a few words. Petrol consumption indicates mileage, mileage means wear and tear of roads. I quite agree with Mr. Hills that motorists should pay in proportion to the damage done to the roads, and in my mind the tax on petrol is the only fair way of making them do so.

NEMO. fair way of making them do so.

Norwich.

Sir,-"Eight Year Old h.p. J.A.P." states that unfairness lies in taxing old machines which originally cost, say, £50, the same as modern motor cycles which cost £150.

Surely the basis of taxation is cost of road repairs. A machine eight years old will do just as much damage as new motor cycles.

In my opinion the fairest method of taxation is taxing by the capacity of the cylinder or cylinders.

B. H. JOHNSON.

Sir,-The present system is more fair to the poorer class of motor cycle owners than the proposed method of taxation. Observing that the Government are seeking fresh means to belp the National Exchequer, as an alternative why not impose a small Inland Revenue licence, say a few shillings a year, on pedal cyclists? I think the average pedal cyclist would not complain at this, observing that it would give him more compann at this, observing that it would give him more voice in the matter of "Rights of the Road." Gillingham. PEDAL CYCLIST.

Sir,-The suggested £3 a year for a motor cycle is a large amount for anyone with a small income to pay, and in the event of it becoming law, many will have to give up motor cycling, and sell their machines, as an income of about £160 a year will not permit anyone to keep a wife, child, and a home going, and pay £3 a year motor cycle tax, and just use the machine occasionally when it is fine weather.

I think our motor cycling associations should insist on the tax being put on the fuel, which would be the fairest method for everyone. FAIR PLAY.

Millbrook.

Sir,-Let us analyse the new taxation and its effects on the working man. To arrive at the amount, a distance of 5,000 miles has been assumed as an average distance covered during the year. Thousands of riders will not cover more than 2,000, and can only use their machines twice a week (perhaps sixty-six runs), and will run an average distance of thirty miles each outing.

The standing charges will be for a 5-6 h.p. combination: Tax, £4; driver's licence, 5s.; club, 10s.; insurance, say, £3 15s.; a total of £8 10s. For a distance of 2,000 miles it works out at well over a penny per mile, or 2s. 6d. every

time the machine is used. If the mileage per gallon is fifty, then the machine is used. It the mileage per gallon is may, then the cost of petrol will, at 2s, 6d, per gallon, be 84 of a penny, making a total of 1.84 of a penny per mile. This does not include the cost of oil, repairs, and garaging, which are common to all conditions and not affected by taxations.

To sum up the whole, new taxation and the price of petrol is likely to come such a bandon and the price of petrol is likely to come such a bandon and the price of petrol contents.

is likely to cause such a burden on the industry and sport that thousands will be compelled to lay their machines up indefinitely. No working man can afford to spend a sum of £20 or more to cover a distance of 2,000 miles for pleasure, and that is just what it amounts to.

The key to the whole position seems to be that taxation of petrol is the only fair method of dealing with the question.

SAMUEL TROUNSON.

Sir,-Mr. H. W. Hills says: "Why not tax tyres?" and then claims that in this way the motoring public would each pay his or her own way, with regard to the damage done to the road.

Surely the fairness of this is obvious to all, for I think everyone will admit that the two fly-power scooter, with its tiny wheels, small power, and light weight, cannot possibly do the damage to the road that is done, say, by a big 8 h.p.

combination.

In my district there was a beautiful road, made of tar macadam. Now, this was a main road in and out of the town, and, of course, was the bearer of a great amount of traffic. Well, for years this road stood up to it manfully, and during this time it would have been hard to guess whether it was much used or not, but after a time a motor 'bus service came into action on this road, and I can safely say that in two months the cream was off it, and in another four months it was absolutely ruined. I allude to Yarm Road, which, I feel sure, many of your readers will know. In conclusion, I may add that I am not a scooter maniac,

but a rider of a big twin combination.

Stockton-on-Tees.

Sir,-Since the question of new taxation is apparently Sir,—Since the question of new taxation is apparently assuming such serious proportions, one begins to wonder what the ultimate outcome will be. Whoever is responsible for the new scale proposed should at least be practical and unbiased, as well as being progressive, but the more offereads about the methods of levying the tax the more apparent it becomes that there is something savouring of vindictiveness and persecution of a section of motorists in the originators of a scheme such as we are led to believe is now under consideration. now under consideration.

Obviously, it is not yet recognised that roads were necessary for some purpose or other long before motors came into being, yet it is now almost suggested that the motorist is the only person interested in such things. It hardly seems fair to the average motorist that any exemption from a reasonable share of the petrol tax, for instance, or licensing a reasonable share of the petrof tax, for instance, or incensing rates, should be conceded to the holder of a hackney licence, or to a doctor, or owners of large businesses necessitating the use of heavy motor transport. These services are each most useful in their way, but why extend to them privileges, and, probably, through them to the public, in such a manner as to necessitate the persecution of that section of motorists who are not granted similar concessions?

If the taxes are intended to pay for the upkeep of the roads, then let the wearers of the road and whoever they serve pay, and pay according to services rendered. I contend that a motor cycle, for instance, does not wear the road as much as a coal cart, or a trader's van, in spite of the greater distance covered. The proper method would be to divide the estimated taxes required between motorists and other users in their respective classes, and so far as the and oner users in their respective crasses, and so tar as the motorist section is concerned (inclusive of ordinary cyclists, if more convenient), put the tax on the petrol and tyres, so that payment may be made or economise effected according to the use made of the roads. We cannot all afford to be running here and there just for the sake of consuming petrol and wearing out tyres, and therefore many motorists get only a comparatively small mileage out of their machines per annum, yet we are threatneed with a most unfair method. per annum, yet we are threatened with a most unfair method of increased taxation. ROBERT KIRTON.

A Scooter with Folding Seat. A Miniature Designed and Built by the R.A.C. Engineer.

PARTICULARLY ingenious scooter
has lately been constructed by Mr.
Hudlass, engineer to the Royal
tomobile Club, in his private workp. From the constructional point of
wit is a most excellent job, practically
ry part, even the hub, having been
t by its designer.

they is designer, the weight is lb., but Mr. Hudlass hopes to reduce in The frame is light and strong, and anitably trussed, and at the forward tion of it an Auto-wheel engine is ed, though Mr. Hudlass considers that lore powerful unit would be desirable. Fear portion of the frame is connected the main portion by means of flexible

plings consisting of inations of spring steel, le the lower portions of main and rear frames connected by coil springs tension, which are capol of adjustment to suit weight of the rider by simple method of screwup or unscrewing the

Transmission side

scooter

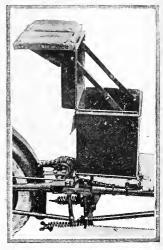

butterlly nuts provided. Long and comfortable footboards are provided, which are capable of being folded up so that the little vehicle will occupy a very small amount of space. The transmission is by a long chain from the engine to a ballbearing countershaft, and thence by short chain to the rear wheel.

Neat Spring Forks.

The design of the front forks is most interesting, and Mr. Hudlass hopes that they may serve equally well on motor bicycles as on scooters. With them side play is quite impossible, while of the four springs the two inner ones are in tension, while the two outer are in compression, and serve to take the rebound. The lower portions of the fork tubes slide into long outer tubes filled with oil. In the scooter the fork tubes or blades are straight, but the designer sees no reason why they should not be curved, as in ordinary motor cycle design.

Not the least ingenious part of the vehicle is the luggage box. When the lid

Not the least ingenious part of the vehicle is the luggage box. When the lid of this is raised, a small cushioned seat is disclosed, which is first placed in position and then laterally extended; consequently the Hudlass scooter will suit equally well the rider who wishes to stand and the rider who prefers to sit.

The Hudlass scooter, showing the springing and seat unfolded.

The band brake on the rear wheel is controlled by a lever on the handle-bars. Despite the small wheels, excellent springing, in conjunction with the large diameter tyres, renders this scooter very comfortable to ride.

Mr. Hudlass is naturally not placing the machine on the market himself, but hopes to have the design taken up by a manufacturer

A New Proprietary Fork.

The "Y" Spring Fork embodying Link Motion and Leaf Springs.

is probably true that last year motor yele manufacturers experienced much aconvenience through the shortage gring forks, which had some influence 1 outputs generally. For this reason e the introduction of a new propriefork is of interest at the present; especially as arrangements are well and for its production on a large scale. Its fork is to be known as the "Y," is the invention of Mr. R. S. Whaley, LLM.E., the designer of the Union stroke engine, who is one of the neers of the Patent Spring Fork Co., 5, Francis Street, Ashted, Birming-The design is based on the theory

The springing system on the Y lork

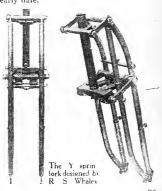

moving motor cycle at angles approximately between 35° to 45°, and that when the front wheel strikes an obstruction the tendency is for the wheel to move backwards, and as it mounts the obstacle to travel upwards.

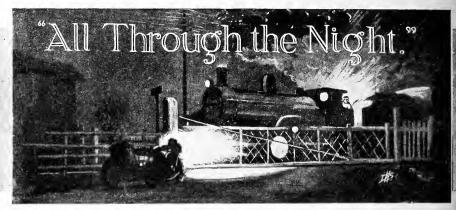

It will be observed that the Y fork embodies two pairs of links of different lengths, and disposed at different angles, which provide a backward and upward movement through an angle of about 45° to the perpendicular.

The construction of the fork should make for quick production. No castings are used, the spring carrier at the foot of the steering stem being a steel pressing, while another pressing is used for the upper link support.

Two leaf springs are used, which are connected by drop shackles to the moving member of the fork.

Arrangements are being made to supply the forks complete with brakework to snit manufacturers' requirements, and we understand that three sizes will be made. The company is now in a position to deliver the lightweight sets, and the heavier types will be available at an early date.

Being an Incident in the Work of a Press Representative, which demonstrates the Utility of the Sidecar Outlit.

MOTOR cyclists, however keen, do not usually attempt long night rides in January for the mere pleasure of compiling a presentable annual mileage, and the writer has no shame in admitting that the run to be described was done perforce.

Word being to hand that a decidedly novel power unit was on the point of production "somewhere in the North," it was urgently required to be reviewed for the benefit of *The Motor Cycle* readers. Railways, unfortunately, do not run to suit the convenience of everyone, and finding it impossible to make a start during the day, a night run by road was necessary.

Preparations for Machine and Rider.

Fortunately, the weather was fine but cold, and as the chains had been recently bathed in grease and a new tyre fitted on the back wheel, no attention was bestowed on the "'bus'' other than filling the oil and petrol tanks and radiator. A complete kit of tools and spare chains was dropped in the sidecar in addition to four gallons of benzole, one quart of oil, and two pounds of carbide. The sidecar also con-

tained a suit case, a heavy photographic outfit, and a set of "sea-dog" oilies. For a run of 140 miles at night the lighting equipment requires preparatory attention. The head light, an F.R.S. Major, is supplied by its own generator, and the sidecar and tail lamp run off another one of P. and H. manufacture. Both of those were scrupulously cleaned and charged with water and carbide, half a pound in each.

For such a ride some regard must also be paid to clothing, and, in addition

to the ordinary attire, an extra pair of socks, a woolle cardigan, a leather vest, two scarves, an old dus coat, and a racing helmet (pace Ixion!) were won The handle-bars are equipped with muffs, and ordinal soft leather gauntlets were used.

Mixed Weather and Rough Roads.

With engine running sweetly and all lamps aligh Coventry was left behind at 9.20 p.m., and whe the outskirts of the town were reached, a gentle rai commenced to fall. The roads were rendered greas thereby, but it was not too unpleasant. Before reaching Leicester it was noticed that the sidecar lamp we out, and a stop was made to relight it. High spee was not attempted, and two hours were spent in covering the first twenty-seven miles. The first six mile out of Leicester (as far as Six Hills on the Fosseway is a nightmare road—huge pot-holes, inches of mud and long stretches of unrolled stones abound, and the powerful beam of the head lamp was appreciated.

Passing into Nottinghamshire, the road improves and mile after mile was reeled off at about 25 m.p.h.

one stop being experience due to a sooted plug result ing from using the hand pump instead of relying entirely on the automatic system. This stop onl lost five minutes, as th writer invariably carries haversack (dear relic!), i which is placed petro squirt, plug spanner, spar plug, the priceless B.S.A spanner which fits almos every nut on the machine and a flash lamp. little equipment, which meets most running require ments, saves both languag and wear and tear of the toolbag fastenings.

A powerful head lamp is appreciated on bad roads. . .

'All Through the Night."-

The run along the Fosseway was delightful, the road being bounded on each side by rolling country, and the head lamp picked out a broad and brilliant path for some distance on the straight road ahead. Thanks to the extra clothing and a following wind, no discomfort was felt from the cold, and the heavens were alternately starlit and cloudy.

A Nocturne.

"The o'ercast, bright stars are gleaming All through the night."

The tranquillity expressed in the words of the old

Velsh song was im-ressive. To scurry cross the face of he silent country in little blaze of ight which accentutes the darkness is realise one's isolaion in the immenity of night; the ven monotone of ne two-stroke twin id not shatter the uietness of things. At Newark the decar lamp was gain lighted, but ie precaution was

One of the worst roads in England-the Fosseway, near Leicester. "Daylight showed the potholes, which are not seen at night.

anecessary, for the town was wrapt in sleep. Passig the level crossing, I noticed a slight drag on the eering, and suspected the cause. Inspection veried that one of the spring fork bushes which had been securely replaced, after removal for a packing of ease, had become loose. Its fitting entailed removing e front wheel and a brake shoe, and the whole job as done in ten minutes with the B.S.A. spanner. xcellent running was made up the Great North Road, ith no stops (other than a wait at a level crossing hilst a goods train lumbered by) until Doncaster was ached. The sidecar lamp was again out, and it may re be said that it is of a nameless and barbarous sign, being an egg-shaped aluminium casting having ur air-holes below and five above. When standing e lamp becomes filled with the products of comistion, and the flame expires in a ghostly glimmer. hen on the move it is promptly blown out if windy, dies out after a short distance. The said lamp s disturbed my recording angel.

The Gleam of Furnaces.

After leaving the main road, Pontefract was passed 4.15 a.m. (the pavé here was reminiscent of D.R.

Some miles of an evil tram track were traversed, until the distant gleam of steel works and furnaces told us to branch off still deeper into the heart of West Yorkshire. A little further on the tank went

dry, and a brief calculation while re-filling proved the consumption to be 65 m.p.g.

Without further incident the end of the 140 mile run was reached at 5.20 a.m. (171 m.p.h. average). generators, which had not been recharged, were still supplying gas, and neither head nor tail lights had given any trouble.

The Day's Work.

After a two-hour sleep the work in hand was commenced, and a busy day was spent noting, sketching,

and photographing the object of the journey. The evening was devoted to developing plates and "writing-up" a lengthy and detailed report. After that a welcome rest was sought.

The Road in Daylight.

I had intended to start at 10 a.m. next day, but after refilling with oil and petrol I again noticed that the front fork bush was out of place, and this was remedied. The actual start was made at 10.35. Daylight showed the pot-holes which are not seen at night, and despite a head wind all the way, the return run was made in exactly six hours, Coventry being reached at 4.35 p.m. with the one stop for refilling the tank (average 23.3 m.p.h.). The wind and increased speed lowered the consumption to 50 m.p.g., and the consumption over the double journey equals 57.5 m:p.g. The average speed over the double journey equals 20.4 m.p.h.

. In proof of the negligible effect of vibration, even on a machine fitted with a rigid frame, it was possible immediately on arrival to commence work on a set of mechanical detail drawings with a perfectly steady hand.

MECHANICAL ENGINE STARTERS.

O far very few inventors have turned their attention to devices of a mechanical nature to take the place of the "kick starter." The conntional pedal starter is certainly efficient, but its is hardly more graceful than the winding of a t engine by its starting handle. No modern car is garded as complete unless it is fitted with an electrical rter, but on a motor cycle perhaps electricity is t likely to be considered in this direction for some ne to come if only on the score of added weight

and expense. Nevertheless, it would be interesting to know why the electrical starter was dropped by the Hendee Co., who, it may be remembered, fitted such a device on one of their electrical models a few years ago. Very few machines have been equipped with mechanical starters other than the type of present-day kick starter, and undoubtedly the problem is not a very easy one to solve, but if inventors would turn their attention to devices such as starters, there is undoubtedly great scope for their ingenuity.

International Competition.

In which the Desirability of Supporting Overseas Events is Advocated.

OW that the world is once more settling down to peaceful pursuits, the time is perhaps propidious to refer to international competitions. In the past British sportsmen have never been loth to enter into competition with the sportsmen of other countries on the latter's own ground; but, except for a British representative entry in Continental reliability trials, the motor cyclist of this country is unknown

The Tourist Trophy Race, which is an international event, generally attracts a few entries from America and the Continent, despite the fact that the types of machines developed by the races are typically British. In other words, America, for instance, has to design and build special machines of a type with which they are comparatively unfamiliar, though little is done on this side of the Atlantic to support American events, which cater for an altogether larger machine.

A strong effort is being made in the U.S.A. to create an interest in the 1920 T.T., with the sole idea that in return British riders may be tempted to compete in the American international two hundred miles race in September: an event which approximates in importance to the T.T. races.

The Sporting Spirit.

In the days when pedal cycle racing was in greater vogue, British speedmen were to be seen on all the important tracks of the world; yet, excepting the Grand Prix of France, British motor cycle racers have rarely been in evidence. This is unfortunate if we are to maintain our reputation as an enterprising nation, and we have no doubt that a British team at the American event would receive a splendid reception, especially this year, when international competitions will be

headed by the America Cup contest—the blue riban of the yachting world—which will be held about th same time.

At the present time the only intercourse between th two great English-speaking races is connected wit commerce. Cannot British motor cyclists do some thing to assist in cementing present relations by mean which do not take into account the influence of finance

A Team for America.

In the past Britain's international representation has generally been left to the individual. The America Cup provides an example of the difference between British and American methods in this connection. This great international event will be between Sir Thomas Lipton's Shamrock and a yacht built be a syndicate of New York yachtsmen. Would it not be possible for British motor cyclists to create a function finance a team of motor cyclists to represent the "old" country in the "new" world.

THE TOOL BAG.

Considering the condition of present-day roads and that also of the tools after a few miles in a panner bay on the carrier, it is surprising that the majority of manufacturers continue to fit these bags on a poin of the machine which suffers vibration more than any other. This practice is probably due to preceden and convenience, but there is no reason why a toolbay or box should not be fitted on the top of the tank as on several machines, or in the diamond of the frame, as on the new Raleigh flat twin, in which positions they are less liable to be damaged through vibration.

The Coventry Premier in Scotland.

SERIES of demonstrations the as to capabilities of the Coventry Premier Runabout were recently given in Glasgow, subsequent to the motor show, by Mr. R. P. Monk, who is associated with the manufac-This little three-wheeler, it will be remembered, is fitted with an 8-10 h.p. V twin watercooled engine, shaft drive to gear box which gives three

speeds and reverse,

and final drive by chain in quickly detachable case.

Our Scottish representative enjoyed a short trip round Glasgow, and was impressed by the manner in

The 8 h.p. Coventry Premier climbing one of Glasgow's many test hills

which the hills encountered were climbed without effort.

Among others, Balmano Brae, the steepest gradient in the town, was tackled on the bottom gear of 11 to 1, and an ascent made without effort. The points which were especially noticeable included absence of vibration, quick acceleration. ample power, and extreme handiness in traffic. The machine was driven up from Coventry, Mr. Monk

experiencing no trouble during the whole journey, and after spending a few days in Glasgow he left for the south by road.

FRICTION CLUTCHES FOR MOTOR CYCLES.

By R. WARING-BROWN, AMIA.E.

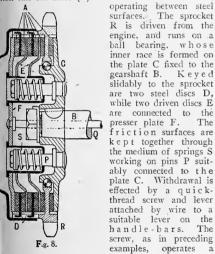

Part II.—Some Remarks on Clutch Design and Descriptions of the Best Known Types.

The first part of this article (published on February 12th, pages 175-7) treated of the general design of motor cycle elutches, and contained detailed descriptions of several popular models. In the following pages will be found some account of dry plate clutches, together with some remarks on the coefficients of friction between various surfaces and notes on clutch position.

Dry Plate Clutches.

HIS type of clutch is rapidly coming into favour, and is undoubtedly the most satisfactory type obtainable, since it is sweet in action, capable of considerable amount of slipping without overheating, it is durable in use. Clutches of the dry plate type like either cork inserts or fabric as the friction

In fig. 8 is illustrated the Sturmey-Archer clutch, hich has six discs (A) of Ferodo friction material,

1 Q through the centre of the gearshaft, which pushed against the pressure plate. This clutch is unutedly one of the best of its species, and has been opted by many of the large manufacturers. The lef point calling for criticism is the fact that wear the friction surfaces would tend to move the position of the chain sprocket, thereby causing the drive on the engine to the gear to be out of alignment.

Ball bearings in clutches are always a weak feature, ing to the fact that the heat generated in slipping events adequate lubrication. In practice also, oil is through the gear box to the clutch, in consequence which the first friction ring seems to suffer, and ariably wears out infinitely quicker than the others. is interesting to note that the American Harley-widson machine, equipped with a clutch of very illar design, does not use a ball bearing for the tocket wheel, but a bush of phosphor bronze, of

ample proportions. Also, only one clutch spring is used, and more provision is made to prevent an excess of oil in the clutch.

A dry plate clutch having cork inserts as a friction medium is shown at fig. 9, that of the well-known American machine, the Indian. In this device the engine drives by a chain on to the loose sprocket O, fitted with the cork inserts, which is clutched between the two discs M and N keyed to the mainshaft X; but while N is firmly fixed by the key, M is free to slide on it. The spring S supplies the required pressure. The clutch is released by a central rod worked by a quick-thread screw, as in preceding examples. This arrangement of clutch is very compact, but it suffers from exposure to dust. Cork inserts form a good friction surface, but are liable to disintegrate in course of time, and consequently act inefficiently.

Friction Surfaces.

The writer considers the question of friction surfaces of the very greatest importance, because where the requirements of a successful clutch can be complied with in their entirety by the combination of certain friction materials, the reduction of weight, and complicity of construction, are bound to follow. In the table below are shown friction coefficients, taken from actual tests of various materials when dry.

Materials.		-Co	efficient	of	Friction U.
					Allowable.
Cast iron on cast iron	• • • •		.170		
			.220		.146
	•••		.180		.120
	•••		.270		
	•••		.340		.230
	•••		.210		
	•••		.250		.166
			.240		.160
			.120		.080
Ferodo on any material			.550		.310

All these tests are shown on absolutely dry surfaces. Where lubricant is present, the coefficients generally depreciate considerably. Consequently, it might be argued that the best clutch would be that which would run dry while satisfying the other necessary conditions. It is, of course, possible to construct clutches having purely metal surfaces, excellent results having been obtained with alternate plates of mild steel and phosphor bronze, lubricated with graphite. However, even with greatest care, attention and favourable conditions, liability to scoring, seizing up, and distortion of the surfaces remains; consequently, attention has turned to the use of non-abrasive materials.

Cork, which is more in evidence in clutches of American origin, has a very good coefficient of friction, particularly, when absolutely dry. The cork used for this purpose is generally prepared as follows: Small

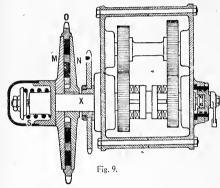

Friction Clutches for Motor Cycles .-

pieces of cork are compressed into sheets or blocks under great pressure and under enough heat to cause the natural gums of the cork to exude and act as a binder. The cork, of course, is even then compressible to a certain degree.

The Three-plate Clutch,

It is customary to make the cork plugs of such size that they project about \$\frac{1}{16}\$ in, above the surface of the plate in which they are fitted. Hence, when the discs are forced together, the contact is at first between metal and cork only, and owing to the compressibility of the cork, the engagement is very smooth. This is the unique and valuable feature of this material. However, when the full pressure of the clutch spring is applied to the friction surfaces, the corks are compressed flush with the plate, and one of the surfaces is then part metal and part cork. This, of course, will reduce the effective friction coefficient considerably, depending upon the relative area of the corks and the metal. As a rule, the cork covers from twenty to fifty per cent, of the total area of the discs.

The majority of clutches of this type are of the three-plate variety, the middle plate containing the corks. The corks are boiled, and thereby softened, before pressing them into the plates; the part of the cork protruding swells: consequently a good fixing is obtained. Under high temperatures cork is liable to char quickly. This is partially prevented by lubrication, but, of course, this is detrimental to the friction.

From the foregoing, attention is naturally focussed on to the question of fabric friction surfaces. The chief property of such material should be its high friction coefficient. It should also be impervious, insoluble, and durable. It should resist the destructive action of slipping, require no attention, and be easily attached to the necessary surfaces.

Clutch Position.

From a survey of current design it will be noted that the clutch is fitted either in the engine-shaft, gear shaft, or rear axle.

In the latest designs of motor cycle, where a speed gear is fitted, it is practically standard practice to fi the clutch on a gear countershaft running at hal engine speed. Obviously, this is quite incorrect, as if two clutches of similar design are considered, on being run at engine speed, and the other at halengine speed, the former could be half the effective diameter of the other and yet transmit the same power provided the spring pressure be unaltered. Alterna tively, it might be of the same diameter, using halof the spring pressure, thus making for easy contro and long life of the clutch. Evidently, therefore, no advantage whatever can be gained by running the clutch at half engine speed instead of at engine speed as a dry plate clutch could be designed considerable lighter, with a lighter spring pressure, and with fa greater durability and simplicity than any countershaf clutch now known. Actually, of course, the clutch should be run at the highest possible speed, and it i absolutely essential that it be placed between th engine and the gear.

In arranging a clutch in the engine flywheel, ther are, of course, difficulties to contend with in engine having internal flywheels, but they can be overcome while where outside flywheel is used, the position i considerably simplified.

Conclusion.

In drawing conclusions from current practice, th writer believes the following offers the basis for good clutch:

Position .- In engine flywheel.

Type.—Dry plate, single disc.

Friction Surfaces.—Ferodo on cast iron or steel Spring Pressure.—Should be balanced whe clutch is in or out of action.

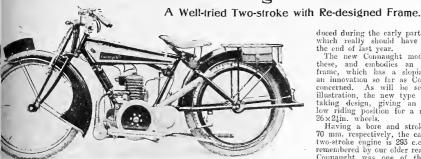

Further, it is suggested that the modern machin requires considerable alterations. Belts as a final drivare undoubtedly being displaced by chains. Chain require lubrication and periodical attention, and the writer believes they will be ultimately replaced by the adoption of shaft drive, similar to the F.N. Thengine would be turned round, with flywheel facing the rear wheel, allowing, in consequence, the fitting of a clutch of ample dimensions. The fitting of such a drive can give at least ninety per cent. efficiency which is quite as much as can be obtained with an other drive on a motor cycle of conventional design

AN ACCUMULATOR WRINKLE,

Many sidecar outfits are now fitted with electric lamps which are supplied with current from a set of accumulators housed in the body of the sidecar. A member of our staff had the unpleasant expérience of discovering, late at night, that both accumulators fitted to his machine had, apparently, run completely down, the filaments of the bulbs not even reddening

when the current was switched on. A dimly remen bered wrinkle was put into execution, and the accumulators immersed nearly to the top in water—just be enough to bear the hand in comfortably. Five minute of this treatment had the desired effect, and a furthet two hours of satisfactory light obtained with no furthet trouble.

The New Connaught Model.

e 1920 model Connaught, it will be observed, has a newly-designed frame. The engine c.c. is 293 mm.

IITE a large number of motor cycle manufacturers were so busy during 1919 they were unable to commence stions upon their 1920 models until

the moulders' strike made matters so difficult that they could not be got ready for the Olympia Show. For this reason there may be several new models introduced during the early part of this year, which really should have appeared at the end of last year.

The new Connaught model is one of these, and embodies an entirely new frame, which has a sloping top tube, an innovation so far as Connaughts are concerned. As will be seen from the illustration, the new type is of quite a taking design, giving an exceptionally low riding position for a machine with 26×24in. wheels.

Having a bore and stroke of 73 and 70 mm, respectively, the capacity of the two-stroke engine is 293 c.c. It will be remembered by our older readers that the Connaught was one of the firms who pioneered the air-cooled two-stroke for weter capacity and the cooled two-stroke for motor cycles, and also that it enjoys a splendid reputation for its economical

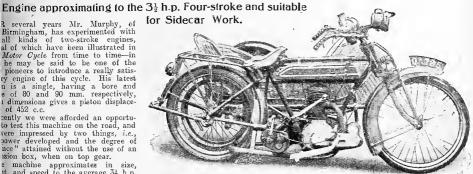

Brampton forks, Dunlop tyres, Sturmey-Archer three-speed gear, and well designed mudguards are included in the equipment.

A 452 c.c. Two-stroke.

several years Mr. Murphy, of Birmingham, has experimented with all kinds of two-stroke engines, al of which have been illustrated in Motor Cycle from time to time—in he may be said to be one of the pioneers to introduce a really satisry engine of this cycle. His latest e of 80 and 90 mm. respectively,
dimensions gives a piston displaceof 452 c.c.

cently we were afforded an opportuto test this machine on the road, and vere impressed by two things, i.e., power developed and the degree of nce" attained without the use of an usion box, when on top gear.

e machine approximates in size, it, and speed to the average $3\frac{1}{2}$ h.p. it, and speed to the average 52 h.p. stroke, while, as regards power, there id no doubt that it would propel a er load than the 500 c.c. four-stroke. machine illustrated is the experial model which has been doing duty works tender for several months, and

An experimental model two-stroke of 452 c.c. designed by a Birmingham engineer.

we understand it is Mr. Murphy's intention to market the machine when several important contracts which now occupy his plant are completed. The whole machine is pleasing in appearance, and of ample strength for sidecar work.

THE DUNELT BIG TWO-STROKE.

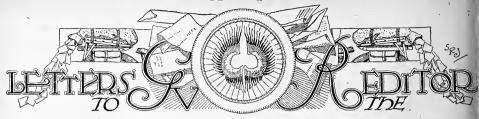

SITORS to Olympia last November will no doubt remember the Dunelt big single two-stroke machine exhi-by Messrs. Dunford and Elliott field), Ltd. No orders were accepted is machine, as the company did not

desire to enter the market until the machine had been subjected to an exhaustive test, and an adequate manufacturing and sales organisation had been got together. The machines are now on the road, and are behaving in a very promising manner, but some time must elapse before they can be marketed.

Last week we witnessed a demonstration of the engine's capabilities on "the bench," and, despite long running on full throttle, the engine did not overheat.

SPRING NUMBER AND BUYERS' GUIDE.

MARCH 25th has been fixed as the date of the Annual Spring Number of The Motor Cycle. Special articles are in course of preparation, and a feature of the issue will be an illustrated Buyers' Guide.

The Editor does not hold himself responsible for the opinions of his correspondents. All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Covenity, and must be accompanied by the writer's name and address.

Sir,-In order to create competition in motor fuel, I venture to suggest that the right course would be to control the price of raw benzole, so as to give distillers a chance of putting on the market a competitive fuel, and that purchasers should be rationed. This might prevent the wholesale purchase of raw benzole by petrol magnates to freeze out competition.

LOVELL ELLIS.

SIDECAR COUPÉS.

Sir,—The enquiries, as a result of my letter re above in your issue of January 29th, having been too numerous for me to deal with, I should be glad if you would allow me to acknowledge them in a general way in your valuable paper, and to say that the device is not yet on the market, but that I am having some printed matter got out on the subject, and in the meantime crave the indulgence of all those of your readers who sent along enquiries.

W. H. BURLEIGH.

THE SPORTING SINGLE SPEEDER.

Sir,-I notice in your issue of February 5th a letter from "C.E.T.," in which he affirms that, with the exception of the Zenith, Rudge, and Triumph, the solo rider who wants a light, powerful and sporty mount, is not catered for in machines over 2\(\frac{1}{2}\) h.p. This is, of course, quite erroneous, as the Norton \(\frac{1}{2}\) o. has for the past twenty years marketed single-geared belt-driven mounts, and there are now four single-geared Nortons (in addition to chain-driven models), viz., 3½ h.p. Brooklands Special, 3½ h.p. Brooklands Road Special, 3½ h.p. Tourist Trophy, and the Big Four Direct the last three being comfortable and flexible road machines, with speed when required, and undoubtedly the simplest machines of their power made.

JAS, L. NORTON.

Norton Motors, Ltd.

PRICE OF PETROL.

Sir,-The increase of 8d. per gallon on the price of petrol is causing those of us who belong to the A.A. and kindred bodies to realise that the time has come for united action. Doubtless you are receiving scores of letters expressing similar opinion, for members realise that in union lies strength. It is, however, easy to clamour and difficult to offer suggestions of practical value. Might I propose, however, that continued pressure from constituents upon members of Parliament should be brought to bear, in order that discussions and questions in the House of Commons should stimulate the dilatory Committee of Investigation into petrol profits, and also that the Excise obstacles in the way of power alcohol production may be removed? I am perfectly willing, personally, to do all I can locally in the way of organising demonstrations, obtaining lists of signatures, etc., etc. Anyway, it is up to the A.A., etc., to play the game, and get busy on behalf of the motoring public. There are vast numbers on behalf of the motoring public. There are vast numbers of people waiting to fall in behind any attempt at organised resistance against the absurdly high prices now obtaining. J. F. BLYTH, JUN.

Sir,-The statement issued by the Shell Marketing Co. in justification of the recent advance in the price of petrol to 3s. 81d. per gallon is curious. The 3s. 81d. is arrived at by two processes-one of taking various items such as cost f.o.b. New York, etc., and winding up with duty 6d., garage profit 42d., making a total of 3s. 62d. They then go on to state that they take 5% of this 3s. 62d., namely 2d., which is added on to that figure, making a total of 3s. 81d.

As a member of the Profiteering Committee enquiring in the whole question, and which has as yet issued no repor I feel precluded from criticising any of the figures given a to cost, freight, etc., but I think that the public is entitle to enquire why the Shell Marketing Co. arrogate to them selves the right of making a 5% profit on the duty paid the Government and the remuneration allocated to the

Assuming for the moment that the other figures, exclud

Assuming for the moment that the other figures, excluding duty and garage profit, are correct, these total 2s. 8d. and taking the Shell Marketing Co.'s own figure of 5%, is obvious that the figure of 2d. should be reduced to 14d. When it is remembered that our imports of petrol las year total something like 200,000,000 gallons, and that on probable consumption in 1920 will be nearer 250,000,00 gallons, the item of \(\frac{1}{2} d. \) slipped in in this way represents sum of approximately half a million stepling taken from the sum of approximately half a million sterling taken from the public's pocket.

ROBERT H. MONTGOMERY. public's-pocket.

SHAFT DRIVE.

Sir,-I am an F.N. enthusiast, so have been intereste lately in the correspondence regarding it, and I thin I can add a convincing testimony to the merits of the machine—the only machine on the market with perfect transmission.

Mr. Smith asks about wear. At present I have a 7 h, 1914 model, which has certainly had as good a gruelling with sidecar, as any machine could have in the time. On examination, I find the bevels, stub shaft bearing and universal joints practically free from wear, and I ma

say here that should any wear take place in the bevels, etc.

Before having this machine I had a 2½ h.p. F.N. light weight, in constant use summer and winter, in every conceivable sort of weather, for over five years, and for three summers I had the cheek to hitch a coach-built Watsonia sidecar alongside, and during that time my transmission troubles were nil, and the only replacements were one se of bushes (about 5s.).

Now, as regards efficiency. I have yet to see the belt o chain-driven 2½ h.p. which will do what my old 1910 on lung F.N. did, and I may add that the bevels, etc., we practically as good as new when I parted with it. Consumption was 90 m.p.g. sidecar and 120-140 m.p.g. solo. The reason manufacturers do not consider the shaft-driv

more is surely obvious when one compares the cost of pro ducing the different systems.

In conclusion, I would say that I cannot imagine any thing on two or three wheels more ideal than the 7 h.p. F.N., with its beautifully made engine, forced lubrication large wearing surfaces, its very efficient multi disc clutch three-speed box, with foolproof spring change, and the drive—yes, the real drive—which will take you through anything where the tyres can find the bottom, with no more attention than a bit of suitable grease occasionally.

The man who has never ridden a four-cylinder with shaft drive has not tasted motor cycling at its best.

J. S. KNIGHT,

Correspondents are urged to express themselves as concisely as possible, especially in view of the fact that only a small percentage of letters received can possibly be published. Many interesting letters are unavoidably omitted in consequence of their abnormal length.

STON RINGS.

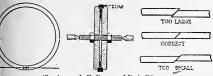

Sir,—The following notes may be acceptable to suppleant the article on piston rings in your issue of January

To manufacture a ring which will exert uniform pressure the cylinder walls throughout its circumference is imssible with any practical variation of section, if the cast-

gis finish turned before cutting the gap.

Perfect results may, however, be obtained as follows:

ore the ring to the size required when expanded. Then agh turn the outside somewhat larger (say .020 per inch diameter) than the finish size required when expanded, d concentric with the bore. Part off to width. Cut the p so that the ring lits into a tube which is as much larger in the cylinder bore as the outside has been turned larger in the finish size. Now to ensure theoretically perfect upe the ends of the ring should be drawn together by ans of a clamp so applied that the opposing forces F tangential to the mean cylindric surface. See sketch, is is difficult in such small rings as are used in petrol tors, so the tube mentioned above may be used, and gives y good results. Now fit a mandrel as shown, remove the aining tube and finish turn the outside diameter to the e of the cylinder if for a new job, or a few thousandths ove size if for replacement in a worn cylinder. Several

(See letter, J. C. Bennett Mitchell.)

gs may be mounted and turned together.

The finish of the rings will be improved if they are now ped in a dummy cylinder of the correct size. A plug represent the piston may be grooved to take a number

When fitting new rings to an old cylinder it should be ne in mind that the bore will be worn slightly larger in meter where the rings work than at the mouth. Thereas the rings, mounted on the piston, must pass the th first, it will be impossible to get a sloping cut ring the really closely at the ends when in position. On the reland, if the new rings pass the mouth, however thand, if the lease off when in place. Step cut rings better for gas-tightness, but more difficult to shape and e fragile.

stated above, replacement rings should be finished htly larger than nominal size. When fitting try them he mouth of the cylinder—without the piston—and trim ends with a fine file to the correct fit. When the ends pressed together as shown, a step of a thousandth of nch is perceptible to the touch, with care.

arrow rings are desirable, but the approximately square ion is less liable to breakage in fitting. Readers who to acquaint themselves with the theory of this subshould turn up Unwin's "Machine Design," Part II., 248-256, and Perry's "Applied Mechanics," p. 404.

J. C. BENNETT MITCHELL.

WINTED-A LUXURIOUS SIDECAR.

-t,—I have been following the correspondence on stain-steel and "Motor cycles de luxe" with some interest, as 1 still hoping (against hope?) that some British manu-arer will shed his brass-bound conservatism and at h put on the market a combination 7-10 h.p. that will a gentleman to get astride it without being immedi-transformed into a bounder. May I here state that not a youthful idiot, with Crœsus for a father, but ly one of a large class who can afford a car, but prefer tor cycle provided one can keep clean on it, and not shamed to ask a lady—not a giggling flapper—to enter idecar.

this end some would go to £300 with pleasure, and i expect decent enamel, real mudguarding, with underis and side shields, silver-plated handle-bars, and bright and last, but not least, the magnificent and safe ican twist grips, and not the dangerous taps so

beloved of the B.P. Mr. M. Reilly is far from the mark when he asserts that the "powerful combination must finally give way to the cycle car."

At the risk of being considered a parrenu, 1 will say that the man in a cycle car resembles a vannan delivering parcels for his shop, and, moreover, a cycle car has "I-can't-quite-afford-a-car" stamped all over it.

I know that the motor cycle is the poor man's car, but there are a multitude of reasonably priced makes for him to choose from. Cannot those for whom price is no object have just one handsome heavy motor cycle de luxe built for them? To would-be scoffers I say (in anticipation), "We want to keep ourselves clean, and our turn-out from looking like the impossible grids one sometimes sees on the roads."

XENOS. Kensington.

WELDING MOTOR CYCLE FRAMES.

Sir,-With reference to the tendency in modern motor cycle and sidecar frames to weld the joints, I should like to draw attention to one point which, hitherto, does not appear to have been appreciated, that is, the effect of the high temperature of welding on the steel tubes used.

Steel tube used in motor cycle and sidecar frames is usually cold-drawn, which cold drawing imparts certain useful physical qualities to it. If this material is heated to, say, 450° C. to 500° C., the effect of the cold drawing is removed without change in the structure, and, as a result, that portion of the frame is slightly weaker.

When welding, however, the metal at the weld is raised to fusion point, and the structure is completely altered.

Assuming the weld to be perfect, i.e., that there is no slag, etc., in it, there is still a section of the tube which has been grossly, though unavoidably, overheated owing to the welding

This overheated portion, which may extend to an inch or an inch and a half away from the actual weld, is very brittle, especially under shock and vibration.

One can, therefore, readily understand that a welded frame is very likely to fail in use, particularly at high speeds on modern "roads."

This brittleness can be removed by heat-treating, or "Normalising," the whole frame after welding, the treatment consisting of heating the frame uniformly to a temperature varying from 730° C. to 850° C. (depending on the carbon content of the steel), allowing it to soak till the temperature is uniform throughout, and then cooling it in

The grain of the metal is then very fine, and the strength, generally, is increased, but it will not be as strong as the original cold-drawn tube, and there is also the risk of distortion.

Again, this reduced strength involves increasing the weight of the frame to compensate, the resultant weight being about the same as a brazed frame with lugs. is thus no advantage in the welded frame over the brazed or even the sweated and pinned types. And if one is unfortunate enough to get a broken tube, it cannot be replaced as easily, or as well, as if the joints had been brazed -in fact, it would most likely be cheaper and more satisfactory in the long run to get a new frame.

I therefore suggest to those who are contemplating welded steel tube frames that it does not pay to heat-treat cold-drawn steel tubes, as a certain loss in strength is inevitable. EO 795. Ipswich.

Preparations for the T.T.

A. R. Fenn, of the Sopwith Co. (A.B.C.), has already been to the I.O.M., and O'Donovan (Norton) is expected in the Island some time this month.

Petrol in Italy.

Owing to the railway strike in Italy, the supply of petrol to all motorists, even the holders of ration cards, is_completely suspended.

I.O.M. Local Government Regulations.

The attention of T.T. entrants is directed to the Light Locomotives (Use and Regulation) Order. 1913, Local Government Board, Isle of Man. Copies of this Order will be issued to all entrants, and may be obtained from Messrs. Brown and Sons, Ltd.. printers, Times Buildings, Athol Street, Douglas.

Second-hand Prices.

It is an indisputable fact that the prices asked for second-hand machines show no tendency to diminish; on the contrary, an increase is noticeable in several instances. This maintenance of price is undoubtedly caused by the brisk demand for machines no longer new, while the continued demand may be attributed to the extremely low output of the new models. A reduction in the prices is not likely in the immediate future, as many prospective purchasers of new machines are deciding not to wait indefinite periods for delivery, and are acquiring second-hand machines in place of 1920 models, the production of which has been delayed by the moulders' strike.

PARIS-NICE TRIAL.
"ALL THROUGH THE NIGHT."
NEW MODELS.

Reunion of D.R.'s.

An effort is being made to hold a reunion dinner of those D.R.-s who served with, or were at any time attached to, Army Headquarters, Salonika Forces. This will probably take place in Birmingham in the early spring, and those interested should communicate with Mr. J. S. Gardner, 40, Coniston Road, Earlsdon, Coventry.

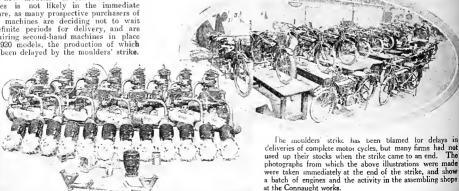

Imports and Exports.

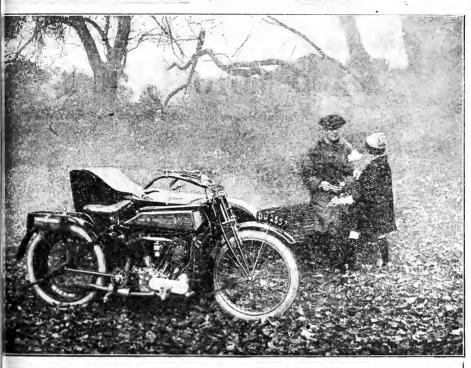

The value of motor cycle imports for January was slightly under December figures, being £35,265, as against £42,360, this amount including tyres, parts, and accessories.

EXPORT FIGURES.

The export of motor cycles is slightly on the upward grade, Jannary figures showing an increase of £8,008 as against the previous month. Compared with the exports of January, 1913, the figures are fairly satisfactory, the number of machines exported almost reaching 1913 figures, their value, of course, being nearly doubled.

EXPORTS DURING JANUARY, 1913. 1919. 19

OFF THE BEATEN TRACK,

as on every highway, one meets motor cyclists displaying "THE BADGE." The practical value of the Auto-Cycle Union's famous token is enthusiastically testified wherever motor cyclists congregate, and in the most out-ofthe-way spots one invariably finds a fellow A.-C.U. Member with whom it is a pleasure to enjoy A.-C.U. advantages.

The A.-C.U. Badge entitles you, among other benefits, to FREE services of the "Get-you-Home" scheme, FREE legal advice and defence, FREE touring and technical assistance, FREE services of the R.A.C. Road Guides, FREE use of a Reading Room at the R.A.C. Headquarters, and SPECIAL INSURANCE FACILITIES.

JOIN TO-DAY and SAFEGUARD ALL YOUR INTERESTS.

Subscription 10/- a Year. From the date of joining at any time.

AUTOMOBILE ASSOCIATION AND MOTOR UNION.

Fanum House, Whitcomb Street, London, W.C.2.

February, 1920.

To the British Public.

THE PRICE OF PETROL.

WHAT IT MEANS TO YOU!!

1896 - 9d. 1906 - 1/4. 1916 - 2/2. 1920 - $3/8\frac{1}{2}$ NEXT YEAR

The exorbitant price exacted from the British public by the petrol interests directly increasing your cost of living, and bids fair to strangle road transport and the motor industry. To live, it is essential that you should be fed, clothed, and housed, all of which are bound up with the road transport question. It is also necessary for you to travel by road by some form of motor traction or another.

Do you realise that the oil magnates are practically deciding how much yo shall pay for the privilege of living in your own country and travelling over it roads?

This is the direct result of being dependent upon imported motor spirit, shipped here by combines, over whom our Government can exercise no control. Every year many millions of money pass from the pockets of the British public into those of the oil kings. All this can be prevented, and those millions can be kept in our own country.

Our common interests in this vital matter can only be attained by bringin home forcibly to the Government that immediate action is necessary.

YOU can help by signing this petition, and then obtaining the signatures of a

your friends; both motorists and non-motorists.

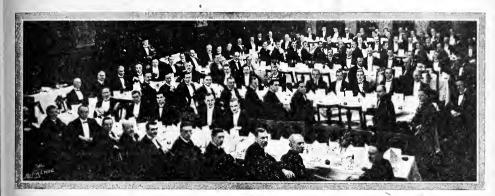

When all the signatures have been obtained, please return the form to:

The Fuels Department, The Automobile Association,

Fanum House, Whitcomb Street, London, W.C.2

Further copies of the Petition can be obtained upon application to th Automobile Association.

Stenson Cocke, Secreta y.

The first annual dinner of the Glasgow Western M.C.C., held on the 7th inst. Details of the 1920 programme of the club were given in last week's issue on page 185.

Memorial to Sir John Alcock

The highest offer up to date for the light car presented by Messrs. Douglas Motors, Ltd., as a subscription to the Sir John Alcock memorial is £625. We referred to this memorial last week,

Police Activity in the Metropolis.

We learn that a police trap is in existence between Elgin Avenue and Suther-land Avenue, West London, which works alternately both ways.

We have also heard that the police are very active in the matter of rear lights in the neighbourhood of Cricklewood.

One of the First Dozen.

Cecil Burney-one of the two wellknown Burney brothers who were associated with the introduction of the blackburne engine—has joined the G.N. company. Burney, with his brother, was me of the first dozen despatch riders to leave England for the seat of war, and tose to the rank of captain.

Benevolent Fund Concert.

The forthcoming concert of the Birming-nam centre of the Cycle and Motor Trades Senevolent Fund which has been arranged take place on Friday the 27th, promises be a success. An excellent programme ias been arranged, and the Temperance tall, Birmingham, makes an ideal concert oom. Tickets are obtainable from Mr. A. C. Huckstepp, 10a, Temple Road, Birmingham.

t'orthcoming Motor Cycle Events.

The fixture list of motor cycle events or 1920, drawn up by the Auto-Cycle Jnion, is now available, and copies may Judy, is now available, and copies may e obtained by writing to the secretary, uto-Cycle Union, 85, Pall Mall, S.W.1. his fixture list will be issued free to be holders of competition licences, the rice to other interested motor cyclists. eing 1s. per copy, post free. This little cooklet contains, in addition to the otor cycle fixtures for 1920, the adresses of all affiliated clubs, a calendar, nd a lighting-up table, and should prove f great interest and assistance to motor yelists who intend participating in cometitions during the year.

Daylight Saving,

The alteration from Greenwich to summer time will this year, in all pro-bability, take place on the last Sunday in March, and continue until the last Sunday in September or the first in October. No special Act is required this year, as some suppose.

Driving Licences by Examination.

Suggestions arise from time to time that driving licences should not be issued without regard to the applicants' qualifications, and the most recent suggestion is that the eyesight of all prospective drivers should be tested under various conditions.

Such a plan would at any rate eliminate the present anomalous state of affairs wherein anyone above a certain age can obtain a licence by complying with the regulation which demands the fee of five shillings as the sole qualification.

Inventor's Machine Stolen.

The New Imperial, fitted with Mr. Hawley Morgan's forced draught cooling device, described recently, has been stolen from the artist-inventor's garage.

No Zenith Entry for T.T.

Zenith Motors, Ltd., write that they fully endorse the views expressed by the Triumph Co. anent this year's T.T., and have decided not to build any special machines for this race, nor will they participate in the event.

Mexican Oil.

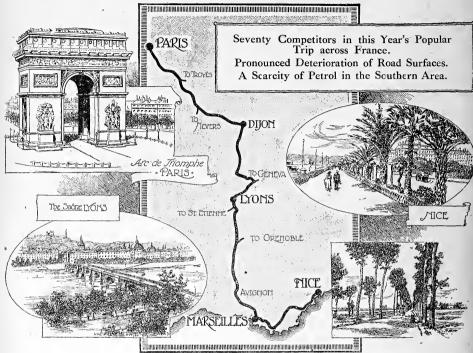

It was recently stated at a meeting of shareholders of the Scottish-American Oil Transport Co. that oil is present in practically unlimited quantities in Mexico, there being over 300 producing wells in the country, with a potential production of 2,000,000 barrels per day. Only about one-fifth of this is being brought above ground on account of the lack of transportation facilities. It is estimated that there are only about 650 oil tankers affoat, and it would require fully 1,500 ships of the average size to carry Mexican oil alone.

Swiss Statistics.

According to the statistics published at Basle, Switzerland, this country ap-pears to have practically relinquished the manufacture of motor cycles during 1919, as imports of these machines are about as imports of these machines are about twelve times greater than exports, the total figures of the former being 640,000 fcs., and the exportations only 53,000 fcs. Switzerland imported from Germany motor cycles to the value of 297,000 fcs., and from this country to the total value of 153,000 fcs.; her exportations to Germany and to this country were nil, and her biggest customer, France, took 33.000 fcs. worth. Whether these figures include engines is not clear from the figures published.

Swiss exports in the first nine months of 1914 amounted to 575.000 fcs., and during the same period of 1913, 587,000 fcs. Her exports have, therefore, come down to nine-tenths of the pre-war figure, while the imports have practically doubled.

THE PARIS-NICE TRIAL.

ONCE again the Paris-Nice trial is largely a competition for British private owners of motor cycles and manufacturers of British machines. It is a matter of sore disappointment to the organiser, Mr. Gaston Sweerts, editor of Motocyclisme, that French manufacturers have taken such a lukewarm interest in the event; but that fact is understandable perhaps when difficulties of production due to lack of raw materials and

duction due to lack of raw materials and

Wayside adjustments to an American Excelsior early in the trial.

differences with labour are taken into account. And let it be repeated here that France has suffered more—much more—

than any other country in the war. That fact is plainly evident from the moment one touches French soil. Road neglect, dilapidated cars and lorries due to inevitable overwork without periodic attention, and dwellings crumbling and rotting are evident on all sides. Every route across the Channel was patron-

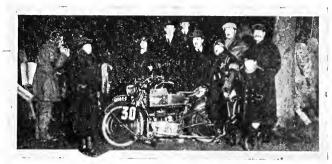

ised by the British competitors. Most of the solo riders, including Rutherford and Newman (with their Sunbeams) Milner (Diamond), and Brunell (two-stroke Triumph) journeyed to Paris by train vio Boulogne; but H. Petty and V. Horsmar crossed on Monday night via Southamptor and Havre, with their Norton sidecars The same boat—the Hautonia, pilote by a keen motor cyclist, Capt. Holt O.B.E., who has recently purchased a 4

Boulevard Bourdon, just outside the city lgates. Here the British riders, in parti-cular, had many interesting experiences to relate of their troubles at the Custom's octroi, or garages, where, apparently, motor cyclists are not particularly popular. One, Geoffrey Hill, who is riding the same Triumph on which he won the Scott Trial, was refused petrol at a garage simply because they did not cater for motor cyclists, and he went out. found a gendarme, and returned to de-mand a supply of petrol, which was at once forthcoming. Hill, fortunately, once forthcoming. Hill, fortunately, speaks French fluently, and, moreover, has just completed five weeks touring in Brittany, so he knows the poor state of the road surfaces as well as anybody. Beyond removing the cylinder to scrape away the carbon, and fitting an R.B magneto—a French production—his production-his machine is as it always was. He uses a scoop of thick cloth to collect warm air from the cylinder to the carburetter, and claims an improvement of five to eight There was a perfect battery of cameras awaiting the competitors at the sealing operations. Spare parts, as well 'as cylinder, frame, carburetter, and wheels, were sealed. It was amusing but significant that the Sunbeam trio produced two chain spring clips and a valve spring as their sum total of spares! One Sunbeam sidecar is chain and belt-driven; the remainder have all-enclosed chain drive.

Reception by the "Petit Journal."

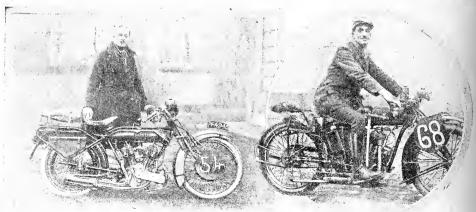

In the evening (Wednesday) all the competitors assembled in the Salle des Fêtes of the Petit Journal, and were officially welcomed by the managing director of the paper, a courteous old gentleman of the Old School, who welcomed the British competitors in a charming speech in English. He told us that he regarded the trial as a continuation of the splendid alliance which existed between the two great nations, and he mentioned how years ago, when at school, he and others had organised games be

MOTOR CYCLE

The Paris-Nice Trial .-

time non-existent in France, had been encouraged.

M. Sweerts then asked the British competitors if they had any questions to ask about the rules. Several then replied that they had not received them. Thereupen a separate meeting was arranged at the end of the lunge room, presided over by Mr. E. M. P. Boilean (The Motor Cycle), who read the most important rules to the assembly, and made all necessary explanations.

explanations The following afternoon the competitors moved away from Paris to Montgeron—the official starting point.

The Start.

On Thursday evening the competitors slid (literally and metaphorically) out of Paris, the execrable road surface early disheartening the solo riders. The Hotel de la Chasse at Montgeron, the official hotel, was crowded, bedroons being occupied by four and five people. By 4 a.m. officials and competitors were astir, and loward 6 a.m. moved out of the village in

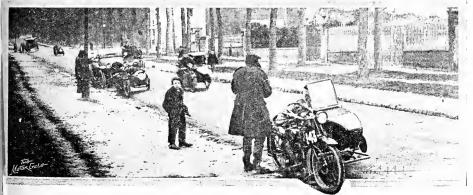

All along the route the public interest was most marked.

In contrast to the twenty-two kilometres after leaving Paris, the going proved excellent, though occasional patches of deep pot-holes were encountered. At the

Two of the Rover sidecars were equipped with Easting screens. A third took the form of a cab,

cross roads car owners and many soldiers were assembled to see the "racers" and to give them a cheer. The dawn brokesoon after the competitors had traversed a few miles from the start, with not too much promise, since "a red sky in the

much promise, since "a red sky in the morning is a shepherd's warning."

Just before entering Fontainebleau we overtook M. C. Moriss (Matchless sidecar) with a broken frame, the down tube having snapped just below the head. This, was repaired with straps, and the

machine was driven under its own power into Fontainebleau, a distance of five miles. Moriss retired.

At the first control in Fontainebleau

the townspeople turned out in force. The Scotts greatly impressed the crowd. The French and the one Italian, as well as the British teams, travelled excellently throughout the run to Auxerres, but continuous jolting is bound to tell its tale before the finish.

Graeme Fenton is putting up a fine performance. His A.B.C. machine left the factory thirty minutes before he was due to leave for the start, and his confrères were even later.

Fred Dover, whose chain-driven Triumph sidecar is one of the benzole test machines, has developed a tiny squeak in the front fork or sidecar (no one can decide which), and this seems to worry the veteran motor cyclist.

The Blériot is a machine which promises to do well. In the early stages riders of these machines were well up to time.

Kaye Don (Zenith), though going well, complained of the pavé.

Four of the Harley-Davidson sidecar entrants.

A Novel Taxation Suggestion.

A Tax on "Motor Spirit" to all Users, with Rebates to Producers according to Profit

HE suggestion put forward by the Minister of Transport's Legislation Committee has aroused a storm of

An alternative suggestion has been propounded by Capt. E. de Normanville, the motoring correspondent of *The Daily Express*. To put the matter very shortly. Express. To put the matter very snortly. Capt. de Normanville recommends the abolition of all taxes on cars and of the existing motor spirit duty. Instead, he contends there should be imposed a flat tax of 1s, per gallon on all motor spirit, whether imported or manufactured in this The tax would be levied on the manufacturer or the importer.

So far, there is nothing of startling originality in the scheme, but Capt. de Normanville combines with the flat tax a system of rebates, payable not to users of certain types of vehicles, but to the manufacturers or importers. The object of the rebates would be to encourage the sale of motor spirit at figures representing fair profits only. The less the profit the greater the rebate.

To take a concrete example, if a company were to trade on such terms that the total dividend that could be paid would not exceed 15% such company would have the value of a 60% rebate on the tax. If the profits were 20%, the

rebate would be reduced to 40% A 25% profit would mean a 20% rebate, and a 70% profit a rebate of 10%.

Two French machines, a Bleriot and a G.L., in the Paris-Nice trial.

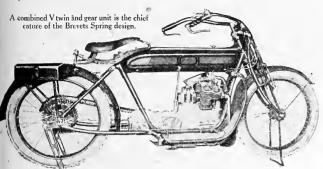

Captain de Normanville thinks-and we are inclined to agree with him-that such a system of taxation would be an encouragement to the manufacturers of home produced fuels, and particularly to those who are prepared to sell their products at a reasonable figure. The profiteer manufacturer would suffer losing the whole, or the greater part, of the possible rebate, and, since the market price for his fael would almost necessarily be considerably higher than that of the manufacturer prepared to trade on, say, a 10% basis of profit, the demand for the product of the former would decline, while the popularity of the latter's production would increase.

There is one considerable objection that may be raised to Captain de Nor-manville's proposal, and this is that if paraffin were excluded from the flat tax, a good deal of revenue would be lost; on the other hand, if paraffin were included, it would be difficult to differentiate between paraffin used for lighting and heating and that used as fuel.

We are inclined to think that, since the scheme still leaves open the defini-tion of "motor spirit," the Board of tion of "motor spirit," the Board of Customs and Excise and the Govern-ment chemists may do everything in their power to prevent its acceptance.

THE BRUSSELS SHOW.

British Machines Predominate. Interesting Belgian Designs.

BELGIUM seems to be preparing for great motor cycle developments, to judge from the exhibition just at Brussels, and from information at Brussels, and from information rathered in different parks of the country. The show, which is the first motor exhi-tion in Belgium since the war, was thrown pen to the public, in the historic and artistic Palais d'Egmont, on February 7th,

and remained open until the 16th. So little is known in England as to what appened in industrial Belgium during the four years of German occupation, that he importance of this exhibition, coming mly a little more than a year after the Armistice, will not be fully appreciated. Although in the greater portion of Belgium here are few external signs of the destruciveness of war, the factories were, without a single exception, stripped absolutely are of both machinery and supplies. Chus, before it was possible to produce, eve tools and machinery had to be sought and brought in from the outside, and the ingineering shops had to wait until the teel plants were in production before they ould do any real work,

The Rate of Exchange.

On this account, it is not surprising at the Brussels motor cycle show should e dominated by English makers, with a prinkling of Americans and Italians.
With the exception of Douglas, the

ritish firms at the Brussels Show were as present, and the firm was also repre-ented by Mr. Davis, of Paris. Despite teir numerical superiority and the highass of goods they showed, the agents r English machines were not altogether uppy. The rate of exchange is so dislvantageous that the dealers did not are quote prices in francs. Thus, when sitors asked the price of a machine-and ey appear to be most keen buyers-the ice was always given in pounds sterling, divery in England.

Notwithstanding this very tuation, orders are being booked and diveries are being made, for there is a al demand among Belgians for good otor cycles.

Although the F.N. did not exhibit at is show, it is understood that the firm almost ready to make deliveries, and pects to produce 15,000 machines during the present year. These will be the well-known single and the four-cylinder types, with a number of detail improve-ments. The next most important Belgian firm is Sarolea, which exhibited a 31 h.p. single with chain-cum-belt drive, and a sporting type sidecar.

The Gillet.

There were two new firms, Gillet and Brevets Spring. The former exhibited two types of machines : a single cylinder two-stroke and a twin-cylinder fourstroke. It was admitted that the latter was not ready for delivery, and not very much information was available regarding it. The two-stroke contains a number of very interesting features, and is a fine piece of work throughout.

· This machine is equipped with twospeeds, contained within the engine base chamber. In all there are five pinions, including those for the magneto gear, and a countershaft is placed ahead of the cylinder, thus increasing the length of model the belt. On the twin-cylinder the same general principle of unit con-struction engine and change speed mechanism is adopted. The engine has mechanism is adopted. The right hand an external flywheel on the right hand side, with the clutch within it, and the drive is taken from a big diameter pulley, by means of a helt, to the rear

The motor cycle, built to the designs of M. Spring, attracted an unusual amount of attention and a great deal of praise. This machine is quite a distinct departure from generally accepted motor cycle practice, and is, undoubtedly, a cycle practice, and is, undoubtedly, a design which will be examined with the greatest interest. As can be judged from the illustration, a cradle frame is used, and in this is mounted a twincylinder unit power plant, clutch, and gear box, on the same general lines as a car engine and gear set.

Great Accessibility.

There is no doubt that any nimblefingered mechanic could take a cylinder off in less than five minutes, for of the four holding-down bolts, three are perfeetly accessible, and the fourth can be reached with a curved box spanner. To get at the timing gear four bolts have to be removed. The valves are side by side, but, of course, facing forwards. Adjustment of the exhaust valve tappet is child's play; the inlet valve tappet is not quite so easy to reach, but it cannot be considered inaccessible. There is a silencer with exhaust cut-out under each of the aluminium running boards.

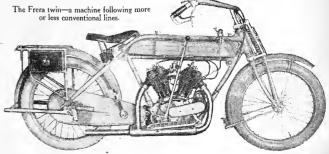

Saddle springing is obtained by means of double, semi-elliptic springs, consisting of a large number of thin leaves. Another interesting feature is the single piece steel stamping rear mudguard with tool boxes. This is strong and light; being a single unit, it cannot rattle, and it can be detached in a few seconds by

and be detached in a few seconds by undoing three winged nuts.

The drive is by chain, having a simple guard above it. Provision has been made for electric lighting. The electric generator will be mounted on the top of the gear box, behind and just below the magneto. On the gear box cover being magneto. On the gear box cover being removed, the electric generator will come away with it without any connections being broken.

Runabouts.

Only two cycle cars were shown, one of these being the well-known G.N., and the other the French S.I.C.A.M. This latter has a two-cylinder vertical aircooled two-stroke engine carried under a bonnet, and final drive by belts and expanding pulleys. A Belgian cycle car, known as the Flaid, is announced to appear shortly.

Gloucester M.C.C.

It has been decided to revive the activities of the club, and at a meeting beld on the 26th ult. the officers for the coming season were elected. All motor cyclists interested should communicate with the hon. secretary, Mr. G. Brooking, 24, Alexandra Road, Gloncester.

Plymouth and District M.C. and L.C.C.

Arrangements have been made for the following events. First Monday in every month, meeting at Mikado Café, Old Town Street, at 7 p.m. First Sunday meeting at the Rock, Yelverton, at 3 p.m. On the second Wednesday and third Saturday in every month, commenc-ing in April, a run will be held. In addition, a reliability trial to Penzance and back has been arranged for April 2nd.

Ilkeston and District M.C.C.

The first annual_dinner was held at the Rutland Hotel on the 10th inst., Captain C. P. Maltby, J.P., presiding. The balance sheet for the past year, showing a satisfactory total in hand, was presented by the chairman, Mr. W. B. Myhill, for confirmation, and approved. Mr. P. Ormiston (captain) gave his report on the club events held last year, which showed the winner to be Mr. W. D. Thornley, who was then presented with a cup and medal by the chairman. An excellent musical programme, which followed, was much appreciated by all present.

Nuneaton and District M.C.C.

The first reliability trial was held on the 12th inst, over a course of about 301 miles, which included several severe hills and a watersplash. Two gold medals and a watersplash. Two gold medals and two silver medals were offered as prizes. Results: Solo.—1, J. A. Watson-Bonne (4 Blackburne); 2, J. Spencer (24 Triumph). Sidecar.—1, C. J. Curren (6 New Imperial); 2, T. R. Alkin (6 A.J.S.). The trial was followed by a most enjoy. able dinner at the Peacock Hotel, at which the medals were presented by the Rev. J. M. Philpott.

Bolton and District M.C.

The activities of the club during 1919 proved a failure, but the coming year promises to be a great success. interesting programme is in course of preparation, and the annual meeting would in ordinary circumstances have been held last week. Owing, however, to the fact that certain members were competing in the Paris-Nice trial, it was decided to postpone the event. Members will be advised by post of the date and place of meeting, which information will also appear in the local press. An urgent appear is extended to all owners of motor cycles and cars in the district to attend and assist with their united support. The hon, sec. is Mr. J. E. Whittaker, 205, St. George's Road, Bolton.

Derby M.C.C.

A meeting will be held in the Unity Hall, Derby, to morrow, the 20th inst., at 7.45 p.m., with the object of reviving the Derby Motor Cycle Club. All motor cyclists in the district who are interested are invited to attend.

Woolwich, Plumstead and District M.C.C.

An enjoyable evening was spent on the occasion of the tenth annual dinner and prize distribution, held recently at the Shakespeare Hotel, Mr. T. W. Longhborough officiating as chairman. Among those present were Mr. H. H. Collier, Major S. Axford, and many old members who had been absent during the war period.

York and District M.C.

It is desired to make the inter-club meet of all the Yorkshire and Northern clubs, which will be held at Richmond on April 2nd, a great success. object the club has been asked-to convene a meeting at York, as being the most central city, of all delegates from the clubs concerned, in order to arrange details. This meeting will therefore be held on the 21st inst. at the Windmill Hotel, Blossom Street, at 5 p.m., when it is earnestly requested that all notified will be present.

Dorchester M.C. and L.C.C.

Officers for the coming season were elected at a meeting held on the 3rd inst., at the King's Arms Hotel. It was decided that the club be affiliated to the A.C.U., that the membership be extended to light car owners, and that the title of the club be changed accordingly. An opening run to Bournemouth has been arranged for March 18th, when it is hoped that all actual and intending members will attend. The joint hon-secretaries are: Mr. A. G. Stone, Lloyds Bank House, and Mr. P. W. Braybrooke, 26, High East Street, Dor-

N.M.C.F.U.

The annual general meeting of the N.M.C.F.U. will be held in the Imperial Hotel, Temple Street, Birmingham, at 7 p.m. on the 26th inst.

The executive meeting will be held during the afternoon of the same day at 4 p.m., also at the Imperial Hotel.

N.M.C.F.U. (Rotherham).

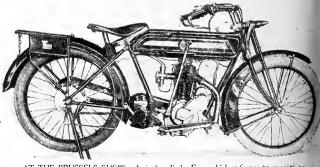

On the 13th inst. a well attended meeting was held at the Y.M.C.A., and a large number of enjoyable runs arranged for the coming year. Intending members can obtain list of benefits and all information from the hon. sec., Mr. H. information from the inon. sec., and it. C. Tarbit Bullows, 34, Frederick Street, Rotherham. The next meeting will be held at P. W. Musson's rooms, Howard Street, at 7.30 p.m., on the 27th inst.

Edinburgh and District M.C.

On the 13th inst. the annual dinner of the above club took place at the Cale-donian Hotel, when the awards for last year's events were presented. A comprehensive and attractive programme has been fixed for this season, including the Scottish Six Days Trial, which will be held June 28th to July 3rd. The evening was a great success, largely owing to the excellent musical programme provided.

Leeds and District M.C.

An enjoyable smoking concert was held on the 6th inst. at the Griffin Hotel, over 130 being present. The list of over 130 being present. officials is now complete, and includes Colonel Sir E. A. Brotherton, Bart., M.P., as president, and Messrs. A. I.
Greenwood, Owen Brooks, Rowland
Winn, H. A. Crawford, and F. O. Winit, H. A. Crawford, and F. C. Langton, as vice-presidents. The hon-secretary is Mr. W. E. Asquith, 11, Moorland Street, Hyde Park, Leeds. A comprehensive list of fixtures has been arranged for the coming season, and social runs, picnics, etc., will take place each month.

AT THE BRUSSELS SHOW. A single-cylinder Frera which at first sight appears to be a composite of two well-known British designs.

lub News .--

Newport and District M.C.C.

A new club for Newport and district as recently been formed, and is being me recently need formed, and is being mithusinstically supported. The secre-say, Mr. A. B. Adams, Clevedon Road, Newport, would be glad to hear from my prospective members.

Cambridge University M.C.C.

A well attended hill-climb was held A well attended hill-climb was held in the 7th inst. at Croyden Hill, there being four classes. The winners were: Juder 350 c.c., S. J. Bassett (23 h.p. bouglas), 37s.; under 600 c.c., B. A. 1all (4 h.p. Trimph), 30s.; open solo, J. H. Rollason (Harley-Davidson), 27s.; assenger machines (including cars), G. A. enkin (Harley-Davidson), 40s.

Middlesex M.C.C.

This club is now reviving its activities, nd will open the season with a dinner, be held at the Holborn Restaurant on be held at the Hollorn Restaurant on adurday, March 6th. An interesting neert to follow has been specially rranged by Mr. W. Rouse, and it is oped that all actual and prospective embers will attend. Application for ckets should be made to Mr. W. Luther moth, 14. Glebc Avenue, Enfield. The cretary is Mr. S. A. McCarthy, 2, ightingale Road, Lower Clapton, Lonon, E.5.

North London M.C.C.

The first general meeting of the inchley and District M.C.C. was held the 6th inst. at the headquarters, ange Tree Hotel, Friern Barnet, when was decided to alter the title of the der that its activities might embrace a der area. Over forty members are now rolled, and all motor cyclists interested ould communicate with Mr. Bernard aley, Burnage, Victoria Avenue, Finchobtained. It has been decided that the ib shall become affiliated to the A.C.U. e opening run will take place on the h inst. to the club's country head-arters at Great Missenden.

recent Cambridge University M.C.C.

Bury and District M.C.

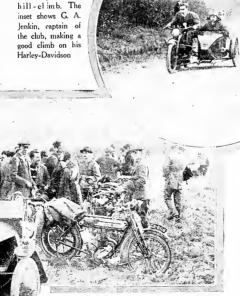

A meeting of the Bury and District M.C. will be held at the Derby Hotel, Bury, to-night, at eight o'clock, with the object of reviving the club. All motorists in the district who are interested are invited to attend.

Lincolnshire M.C.C.

The annual general meeting of the above club was held at the Crown and Anchor Hotel, Lincoln, recently. The secretary's report showed the club to be in a very flourishing condition, while the prospects for the coming season are in every way satisfactory, and the pro-gramme of events is well in hand. The season commences with a hill-climb at Thonock, near Gainsborough, on Easter Monday, April 5th. Mr. F. W. Richard-son, "Hill Crest," Yarborough Road, Lincoln, is again the honorary secretary.

Birmingham M.C.C.

An attractive programme for the next three months has been arranged, which includes many interesting events. A sideboard value £25, two prizes value £10 10s., and five others valued at £5 5s. each, will be put up for competition, in addition to the Victory, Duke, Midland, Sangster, Lycett trophy, and Austin cups.

CAMBRIDGE UNIVERSITY HILL-CLIMB.

Four-wheelers at the Price of Motor Cycles.

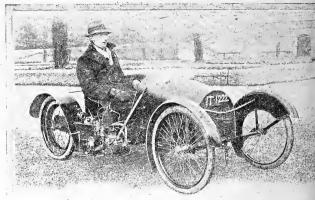

The Black Prince Runabouts with Two-stroke Engines.

E VEN before the war the £100 cycle car was regarded almost as an impossible proposition, and to-day the same ideals are attempted at a figure nearly 100% in excess of that amount. Black Prince Motors, Ltd., however, are introducing two light four-wheelers, which it is proposed to market at the remarkably low prices of 68 guineas and £100, figures which the majority may regard as impossible.

Simple Designs.

It is obvious that at these figures the prospective purchaser will not expect all the refinements of machines at double their price, but when the Black Prince specifications are taken into consideration, one must admit that remarkable value is being offered. Value, of course, depends entirely on the efficiency of a machine to perform the functions for which it has been designed, and when this point has been demonstrated to the satisfaction of the public, then it will only remain for the company to concentrate upon output, for there appears no doubt that at the prices mentioned they will make a very wide appeal.

The first of these little vehicles is the Black Prince Buckboard, which is sprung at the front by means of a single volute spring. The rear part of the "chassis" is not sprung, comfort for the driver and passenger being provided by mounting the

A four-wheeler at the price of a lightweight motor cycle-68 guineas,

two aeroplane bucket seats on large coil

springs.

A 23 h.p. Union two-stroke engine A 23 h.p. Union two-stroke engine provides the power, and drives a countershaft two-speed gear embodying a clutch and kick-starter, the final drive being by

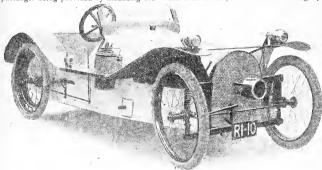

belt. Both engine and gear units are placed on the side of the vehicle after the fashion of the old Chater-Lea rnnabout, a practice which has been followed by several designers both in this and other countries.

The wheels fitted are 26×2in., and the track and wheelbase are 3ft. and 6ft. respectively. It is claimed that petrol consumption is in the neighbourhood of 100 m.p.g. Included in the price of 68 guineas is a set of acetylene lamps with generator.

Mr. Archie J. Cocks, the well-known pre-war competition rider, who is the new sales manager for Black Prince Motors, Ltd., advises us that he recently made the trip from Barnard Castle to Glasgow, on which the little machine proved itself a good hill-climber and capable of 30 m.p.h. on the open road

with two persons aboard.

We described the £100 Black Prince runabout in our issue for December 11th. It suffices now to repeat that its power is provided by two Union two-stroke engines coupled together, and embodies a two-speed epicyclic gear and final belt drive. We look forward to trying these drive. We look forward to trying the interesting machines in the near future.

The Black Prince runabout, a four-wheeler which the makers hope to market at £100

OF INTEREST TO THE T.T. ENTRANTS.

N last week's issue we gave the main conditions and regulations which will govern this year's Tourist Trophy reaces. Below we supplement these regulations by extracts from others which are of interest to the prospective com-

"Each motor cycle will be required to bear three number plates, one of which must be secured in front of the head and one on each side of the back wheel. The numbers on the back wheel must be fixed to the motor cycle before its arrival in the Isle of Man, and must be retained as fixed until after the race. These plates will be of stiff metal, 12in. in diameter, painted with the competitor's number in bold white figures on a black

"Both during practising in the Island and the races each competitor must wear a helmet of an approved type. A list of makes of approved types will be furnished by the A.C.U. on application. A competitor will not be allowed to practise or start in the race if wearing metal-studded

One replenishment depot only will be established at one point on the conrse. Only one attendant may assist in replenishing. No spare parts—as distinct from tyres, fuel, and lubricating oil—other than

those actually on the motor cycle at the start and carried during the race, shall be acquired or used, under penalty of disqualification.

"Any machine which is stopped must immediately be placed on the left-hand side of the road. A competitor is ex-pressly forbidden to drive or wheel.his motor cycle in a direction opposite to that

"The order of starting will be decided by ballot, provided that those com-petitors whose entries shall not have been accepted at ordinary fees shall be started after those whose entries have been so accepted."

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed anvelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Building a Lightweight.

For some time I have been contemplating building a two-stroke motor cycle from component parts, buying them either new or second-hand. I should be pleased if you would give me your prinon on the project.—W.A.C.

firm from whom you buy the engine uld no doubt supply all the necessary ings for assembling a lightweight tor cycle. At the same time, unless have fairly good workshop facilities, should not recommend that you empt this yourself.

Increased Consumption of Speed

Supposing two points, say, twenty miles apart, and a motor cyclist rides the distance slowly. Afterwards he does the same distance, using the same machine, ar ratio, etc., as before, but at a eater speed. Why should his petrol nsumption be greater in the second se? Is it due to more air or wind sistance, thereby causing more power be expended to overcome it? His neels do the same number of revolu-ns, therefore his engine does the me revolutions as when he rode wly.-W.P.

vering the same distance at a greater I it follows that the petrol consumpwill be higher. All other conditions ; equal the increased wind resistance would account for this being so.

Timing Wheels.

Will you enlighten me on the timing of my 23 h.p. 1910 twin Enfield? I bought it with the mainshaft timing pinion missing, and I got one made, and had teeth cut off the forty-tooth wheel, I when it came back it had seventeen h on, but I may say the teeth mesh fectly. When I time the inlet ve to open on the downstroke of piston and the exhaust to open on upward stroke, it will work all it for a revolution or two, but if urn the engine, say, three or four lutions, the exhaust will open on the nward stroke and the inlet on the ard stroke of the piston. Is this ed by having seventeen teeth on half-time wheel instead of sixteen 1? I may say that all four valves off the one camshaft, and the thaft is one piece, so the cams on shaft cannot move. Should I get her wheel with sixteen teeth instead eventeen ?-A.B.

ming trouble with your engine is, se, due to the fact that you have

seventeen teeth on the driving pinion. If the cam wheel has forty teeth, it is obvious that you should have twenty teeth, seeing that the cam wheel must make one revolution to two of the mainshaft wheel. If the cam wheel has thirty-two teeth, you need sixteen teeth on the small pinion.

A Spares Difficulty.

Could you tell me who makes the Alcyon motor cycle? I have got one with several parts missing.—J.B.

The Alcyon machines were made at 30, Avenue de Noailles, Lyon, and they have not been imported into England for many years. We do not think you will be able to get original parts, and if you require any spares you will have to have them made specially.

Removing a Ball Race.

I want to remove the ball bearing in the pulley side of the crank case of my 1914 23 h.p. twin, in order to renew the felt washer which, I see, is between

the ball race and the outer wall of the crank case. I should be much obliged if you would let me know how to remove the ball race.—J.D.C.

Removing ball races from an aluminium crank case is somewhat difficult. The usual method is to warm the crank case slightly and drop it on a level surface, such as the top of a bench. In most cases the ball race will fall out, owing to the expansion of the aluminium. If you cannot remove the ball race by this method, we should recommend that you place it in the hands of a motor mechanic.

THE NEXT STAGE!

MOTOR CYCLISTS interested in small or large cars should read

the forerunner of all motoring journals. Founded in 1895, it remains the largest and most successful automobile paper, and enjoys the greatest circulation. It is universally accepted as the representative British motoring journal.

Lighting from Magneto.

I have an 8 h.p. twin pas-senger machine, which is fitted with accumulator electric light-ing. I have been several times caused annoyance during a long night run through the battery running down, and I should he obliged if you would tell me if there is a device on the market for converting alternating into direct current. If so, what is the name and address of the makers, and the approximate price?—G.B.R.
It is not possible to charge accumulators

directly from primary circuit of a high tension magneto, and there is no device on the market for converting an alternating current into direct current.

Still Running!

Will you kindly advise me as to what you consider the best modern make of carburetter to

fit to an old pattern a.i. valve single-cylinder 2½ h.p. air-cooled engine, fitted in the back wheel of a 1905 Singer tricycle? It was formerly fitted with a Singer carbinetter of surface type. This I replaced by an Amac, with throttle control by Bowden wire, but with the amount of air controlled by a slide. The machine works far steadier than with the Singer works far steader than with the Singer carburetter, but is very poor on hill climbing and difficult to start. The consumption is only 50 to 60 m.p.g., this being, if anything, more than with the former carburetter. The engine the former carburetter. The constant and valves are in good order; also, apparent misfiring. Magthere is no apparent misfiring. Mag-neto is a low tension, rocker, Simmsneto is a low tension, rocker, Simma-Bosch. Of course, the whole engine being built in a Singer wheel makes it difficult to fit a carburetter, the Bowden control passing through the hub to the handle-bar. I have tried several Amac jets, and use the one on which the machine was steadiest. My great difficulty is with starting as this must be done by hard pedalling when the engine is cold. The whole machine is in such splendid condition

machine is in such splendid condition that I am disinclined to scrap it, especially at present.—H.E.B.

In all probability the starting trouble with your machine is due to the inefficiency of the low-tension ignition system. The carburetter you have at present certainly does not appear to be very economical, but as the gear is probably very low, you may not be able to obtain a much better result with any other carburetter. Difficulty in starting is often largely caused by air leaks in the is often largely caused by air leaks in the induction system, and you should eliminate any possible source of these.

READER'S REPLY.

Blow-back.

I notice in a recent issue of The Motor Cycle that the question of curing blow-back was raised by one of your correspondents. This may, of course, be caused by the inlet valve closing late, if the timing is wrong, but is often caused by the exhaust valve closing early through wear of cam and tappet. through wear of cam and tappet. In bad cases this can be cured by retarding the exhaust valve cam one tooth, which may give a little overlap, but is better than having the valve close before the piston reaches the top of its stroke, so causing the inlet valve to open under pressure. Just recently I came across an old engine that would hardly across an old engine that would hardly run, and spat violently out of its car-buretter. The gear wheels were all cor-rectly in mesh with the makers' mark-ings, but retarding the exhaut valve, as I have suggested, made it pull quite well again, and instantly cured the blow-back.—E.M.L. (Colombo).

Alternative return route: Witney, Burford, Cheltenham, Tewkesbury, Worcester, Kidderminster, Bridgnorth, Whitchurch, Chester, Birken-Charlbury, Witney; approxi-30 miles. Alternative return head (ferry), Liverpool, Ormskirk, Preston, Lancaster, Carnforth, Burton, Milnthorpe, Lindale, Newby Bridgs, Green-odd, Ulverston, Barrow.

Motor-propelled Chairs.

A correspondent informs us that the "Raybeck" hand-propelled invalid "Raybeck" hand-properted my and chair, with motor attachment, may be obtained from the manufacturer, whose address is George Street, Blackpool.

The S.A.B. Spark Tester.

When reviewing this device in our issue of the 29th ult., we inadvertently stated that it was handled by the S.A.B. Spark Tester Co., of Cricklewood. We are-asked by Messys. Leo Ripault and Co., of 64a, Poland Street, London, W.1, to state that this accessory is now handled entirely by them.

Messrs. F.N. (England), Ltd.

Mr. A. E. Gelder, who before the war held the position of general manager of Messrs. F.N. (England), Ltd., Kimberley Road, Willesden Lane, N.W.6, has again resumed the position after five years' service with the R.N.V.R. He says that great progress has been made in reconstructing the Belgian factory, and he is most optimistic about the future developments of the company.

Dunhill's Sidecars.

We have received a catalogue of sidecars in which Messrs. Dunhills, Ltd., 359-361, Euston Road, London, N.W.1, are specialising. All the models sold by Messrs. Dunhill are priced and described in this catalogue, while for motor cycle clothing and accessories a special catalogue containing much useful information is issued.

Unwise Motorists.

Quite a considerable proportion of motor cyclists neglect to insure against third party risks, damage, and theft. During the last few days the assistance of the R.A.C. Legal Department has been sought in resisting a large number of claims by third parties in respect of damage done by members to persons or property, and on taking the matter up the Club has found that these risks have not been insured against. It is certainly difficult to imagine any wise motorist neglecting to take the elementary precaution of fully covering himself, his passengers and his machine.

A Two-stroke Honoured.

The Secretary of the Board of Educa-tion has applied to Messrs. F. E. Baker, of King's Norton, Birmingham, for the loan of a Beardmore Precision motor cycle, which will be exhibited at the Science Museum, South Kensington. The Beardmore Precision was described in our columns recently, and marks a striking departure from the conventional. This is the second occasion on which Messrs. F. E. Baker have been honoured with a request of this description: a Precision overhead-valve "V" twin engine already forms a part of the per-manent exhibition at South Kensington. Reward.

Mr. L. R. Reeve, 169, Grange Hill Road, Eltham, S.E.9, is offering 10s. reward to the finder of a special A.J.S. square box spanner and two sparking plugs, in case, dropped from a sidecar on Shooters Hill on January 24th.

Magneto Spares for Scotland.

We hear that Simms Motor Units, Ltd., have opened a branch depot for Scotland at 1,195 Argyll Street, Glasgow, where a full range of magneto spare parts and the company's motor accessories will be kept in stock. There will also be a repair department on the premises.

Sidecar Production.

The Stevens Engineering Co., 184-186, Pentonville Road, London, N.I, informus that they have been able to increase greatly their production of sidecars, which are now known as the Whitworth-Stevens. They are now in a position to give immediate delivery of 1920 models.

M-L Magnetos.

Interesting figures have reached us from the makers of the M-L magnetos regarding their 1919 output, which was considerably in excess of the total produced during 1918, or any previous year, although serious reconstruction and labour difficulties had to be overcome.

Popular Instruments.

The three aeroplanes which are attempting the London-Cairo-Cape flight are fitted with instruments manufactured by Messrs. S. Smith and Sons (M.A.), Ltd. An especially clever fitment is the Smith recording air speed indicator, which automatically records the air speed on special charts.

Messrs. Alldays and Onions' "Slogan".

Messrs. Alldays and Onions, Ltd., recently offered a prize to the members of their staff who suggested the most suitable phrase for use as a "slogan" in connection with Alldays cycles and motor-cycles. The phrase that, has been selected is "Built by Engineers." This phrase is certainly very apt, for Messrs. Alldays and Onions have been in the engineering business for very many years -long before the first bicycle was made.

Catalogues Received.

A list of excellent fittings, such as the Clayrite horn, the rigid locking adjustable handle-bar mirror, and a variety of mechanical horns and other useful novelties suitable for motor cycles and light cars, has just been issued by Clayton Wright, Ltd., Great Hampton Street, Birmingham, and traders are invited to apply for copies. Norton Motors, Ltd., Aston, Birming-

ham. A catalogue of the famous Norton, describing the engine and machine clearly, and dealing with the various models turned out by the firm. It concludes with a page of testimonials and an imposing list of successes won during 1919,

and list of successes won during 1919.

An interesting illustration appears on the cover of the Quadrant folder, depicting an African native on a 1903 Quadrant, photographed by Mr. T. Silver during his visit to that country at that date. The list also shows the 1920 4½ h.p. models, which are priced at £95 and £122 10s, for solo and sidecar machines respectively.

MISCELLANEOUS ADVERTISEMENTS.

ADVERTISEMENTS in these columns -First 12 words 3/-, and 3d. for every aditional word. Paragraphs of under 8 words re charged double rate. Each Name and

aragraph is charged separately. Name and ddress must be counted. Series discounts, onditions, and special terms to regular trade ivertisers will be quoted on application.

Specification and full particulars will be sent on ation. - The Spalding Motor Co., Ltd., Spalding, nting agents for Lincolnshire.

TO THE POTENTIAL. MOTOR CYCLIST

"HIS winter has seen a phenomenal demand for motor cycles and sidecar combinations. Never before have so many people attempted to buy these types of motor vehicles. We say "attempted," for certainly many prospective buyers have been sent empty away. That depends on where they have gone for their machine, of course. The house of Wauchope has had unequalled experience in motor dealing, and has always been in an exceptional position to meet the requirements of its clients. By keeping at all times a very large and varied stock of second-hand machines, and by placing well in advance large contracts for all the principal new models, we have been able even in these abnormal times to keep pace to a large extent with the extraordinary demand.

Now that the moulders' strike, which for so long has delayed the production of 1920 models is ended, deliveries of new machines are daily improving, and we hope soon to be able to offer a large range of post war productions.

At present we have, as usual, a large variety of coach-built sidecars on hand, any of which can be fitted in a few hours to any type of motor cycle. The famous 1920 No. 2 B.S.A. sidecar can, for instance, be immediately delivered from stock, as can also every model of Canoelet, Douglas, and a large variety of other first grade sidecars, ranging from £20.

The Autoped Scooter complete, with electrical equipment, can be supplied from stock at £42.

A number of excellent light cars are also on our premises ready for immediate delivery including Singers, Standards, Citroens, and Morgans.

Call, write, or 'phone immediately and make sure of the machine you require.

THANKS

are extended to all customers for the consideration and indulgence extended during the difficult period of removal from LONDON to New Offices, Warehouse, and Works, at CROYDON.

Conditions are already very much improved and as soon as the Works are in full swing it is hoped that Stocks will be increased to such an extent that deliveries can always be made immediately on receipt of

order.

Many new lines are in course of production, and customers should therefore ask for their name to be added to the mailing list for new Catalogues as issued.

Will all Customers kindly note CHANGE OF ADDRESS:
